

Apache Kylin2.0

从传统OLAP向实时数据仓库演进

马洪宾 | ma@kyligence.io

Kyligence Inc. 技术合伙人 & 高级架构师

Apache Kylin 历史

关于Kyligence

- Kyligence's vision is to unleash big data productivity for everyone's analytics needs.
- The company was founded by the team who created Apache Kylin™, a top open source OLAP engine built for interactive analytics at petabyte-scale data on Hadoop. Kyligence is the primary contributor to the open source Kylin project globally.
- Kyligence provides a leading intelligent data platform to simplify big data analytics from on-premises to cloud.

Interactive

Reporting

Dashboard

OLAP引擎

Apache Kylin

Hadoop

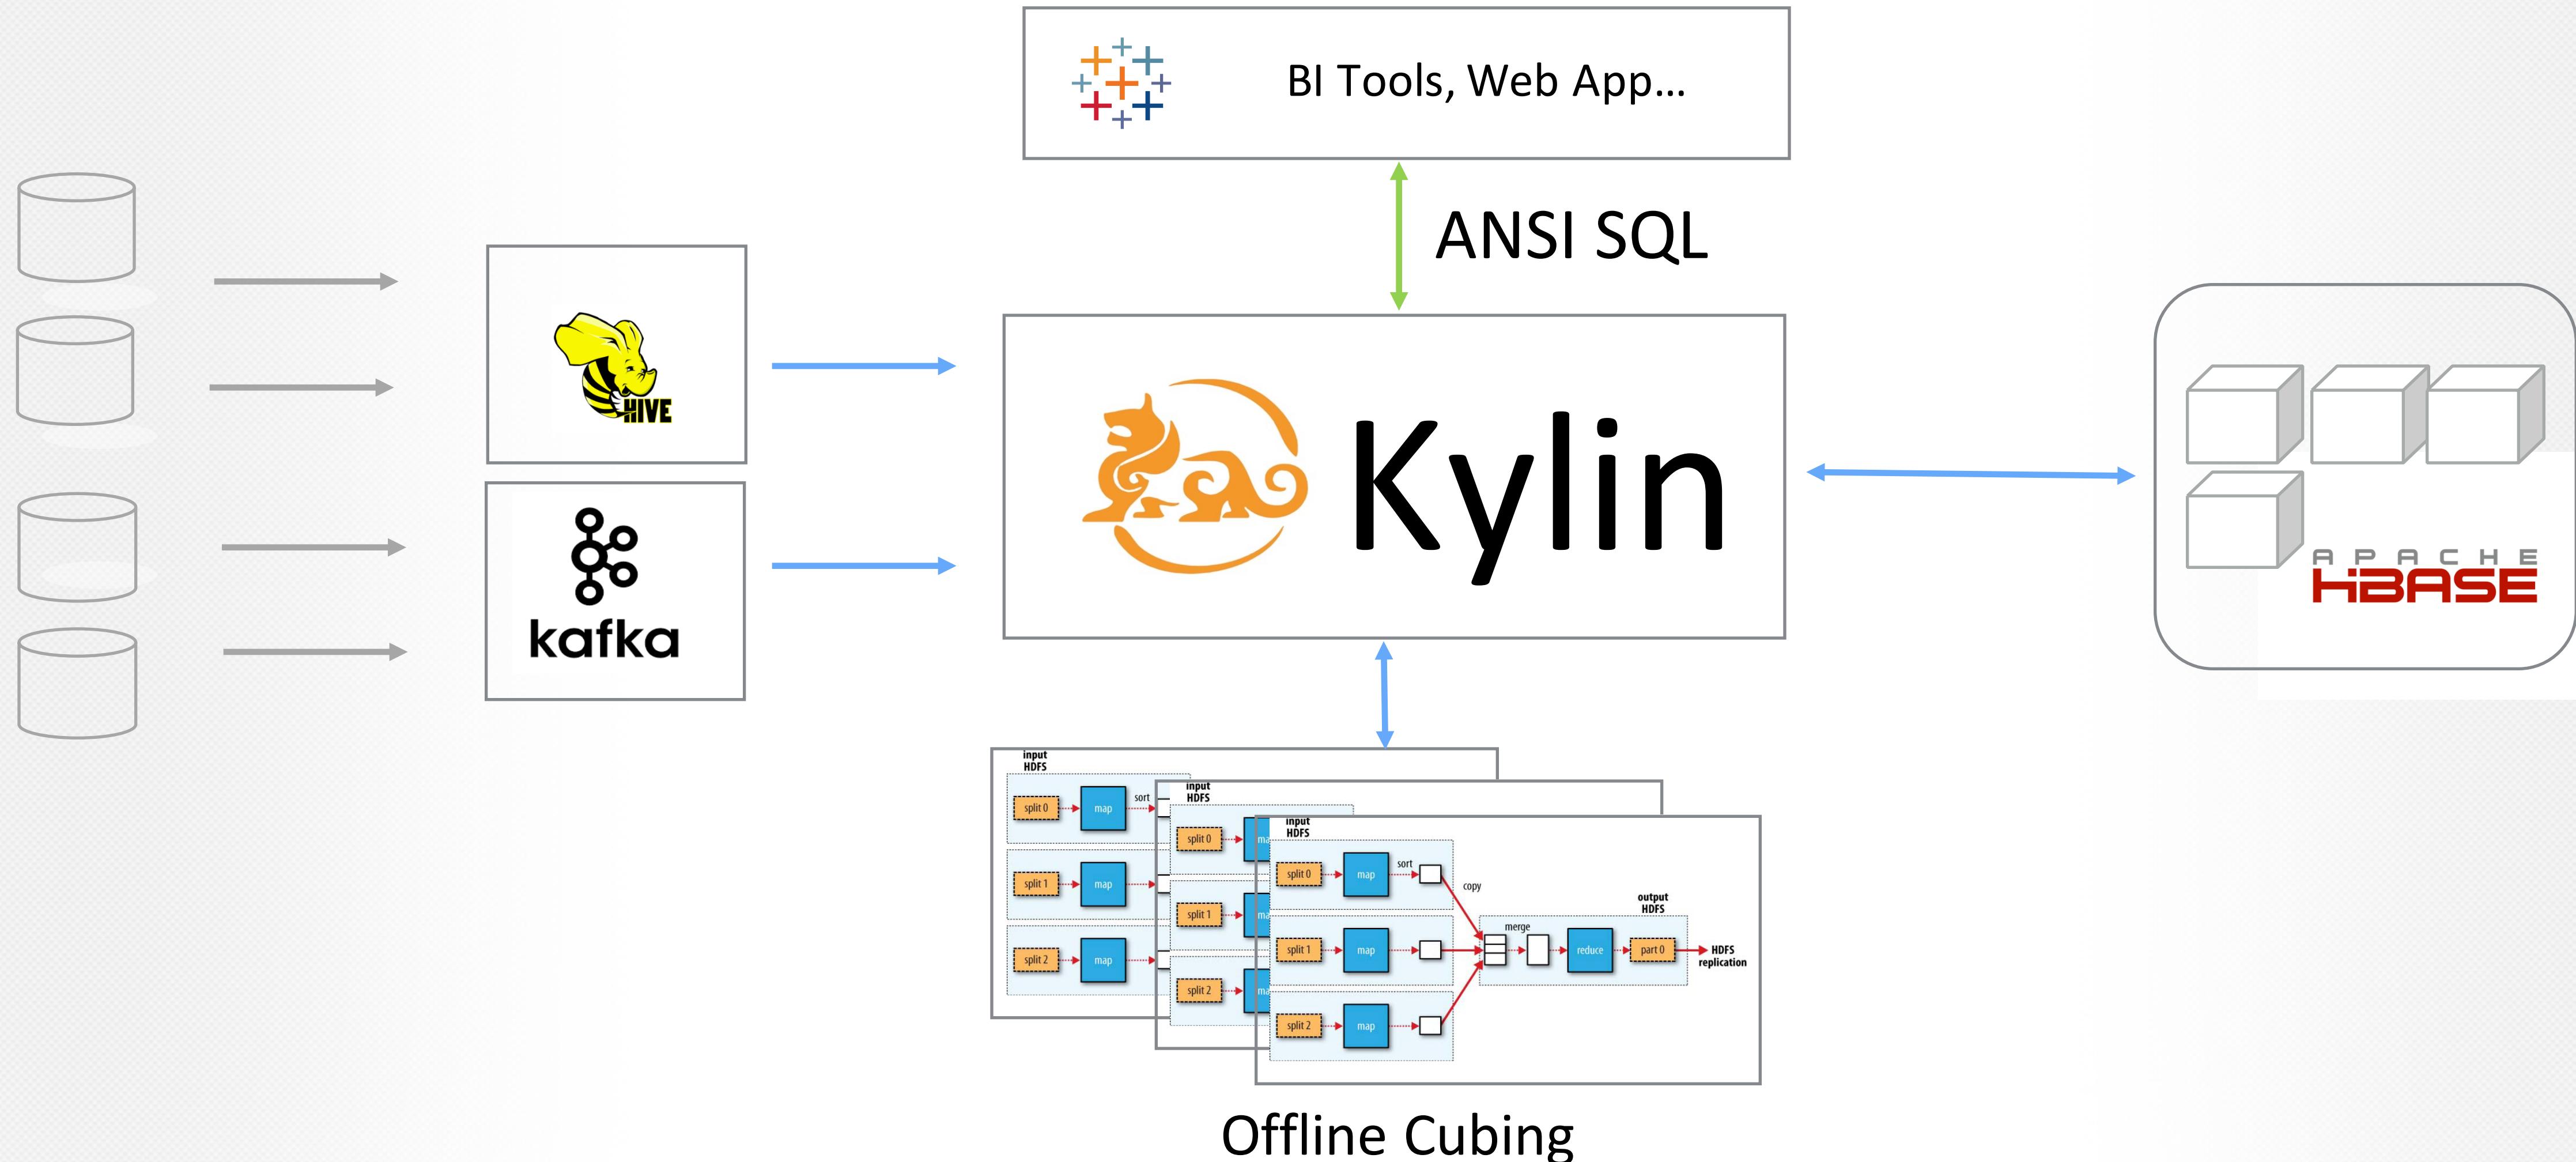

HDFS

Hive

HBase

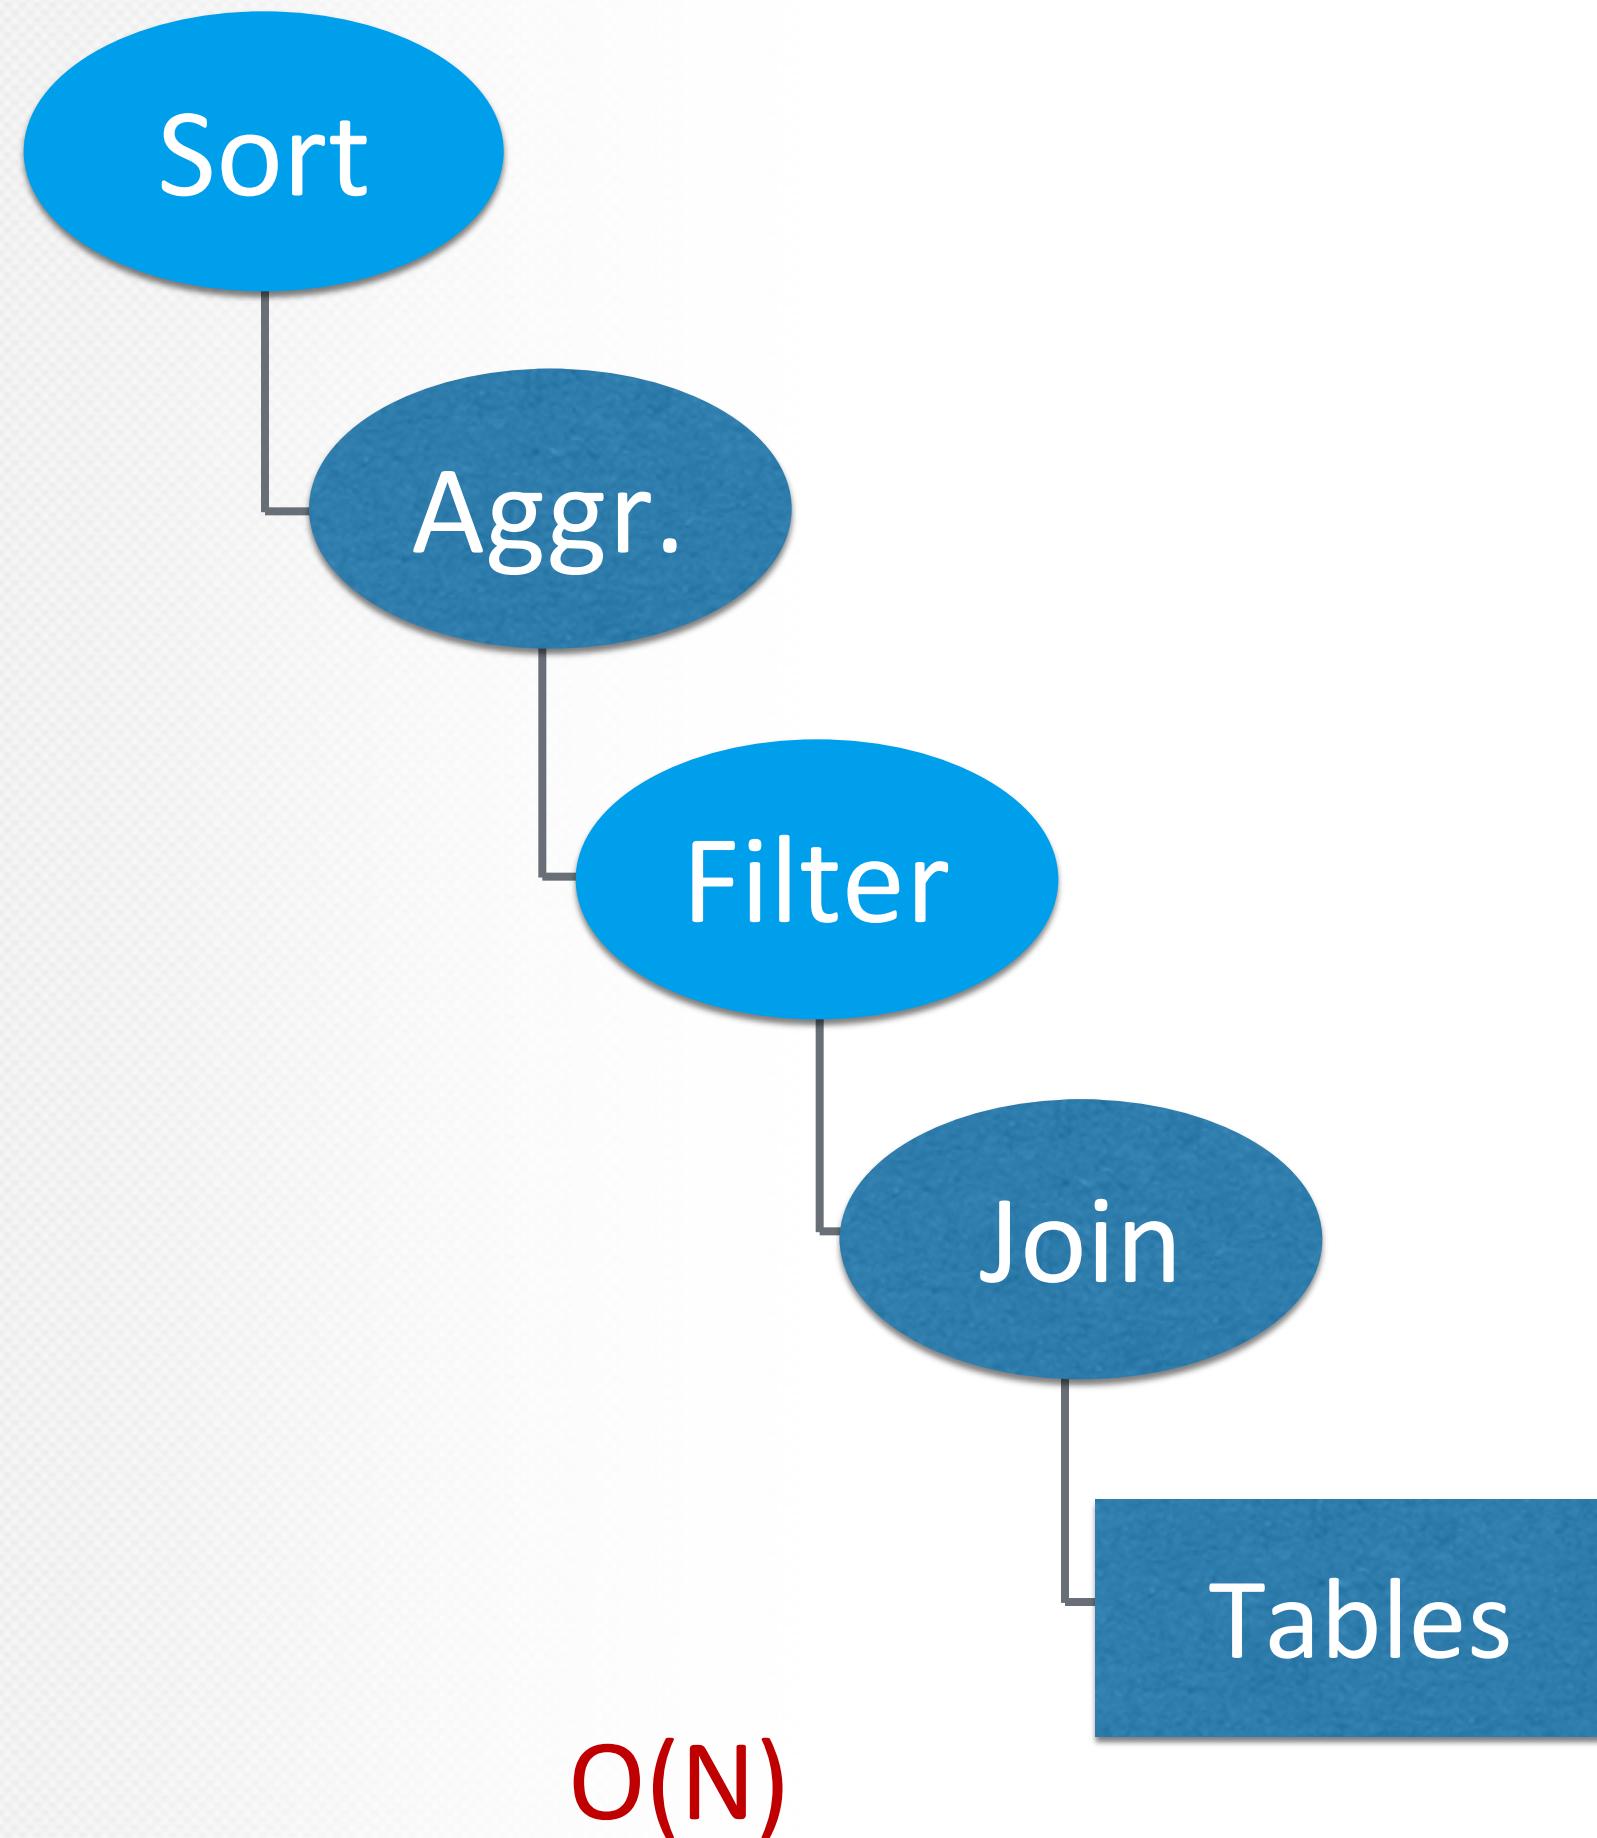

- 3 万亿条数据,
< 1 秒 查询延迟
@头条, 国内第一新闻资讯app
- 60+ 维度的cube
@太平洋保险, 中国三大保险公司之一
- JDBC / ODBC / RestAPI
- BI 集成

Apache Kylin in the Zoo

Offline Cubing

Kylin为什么快

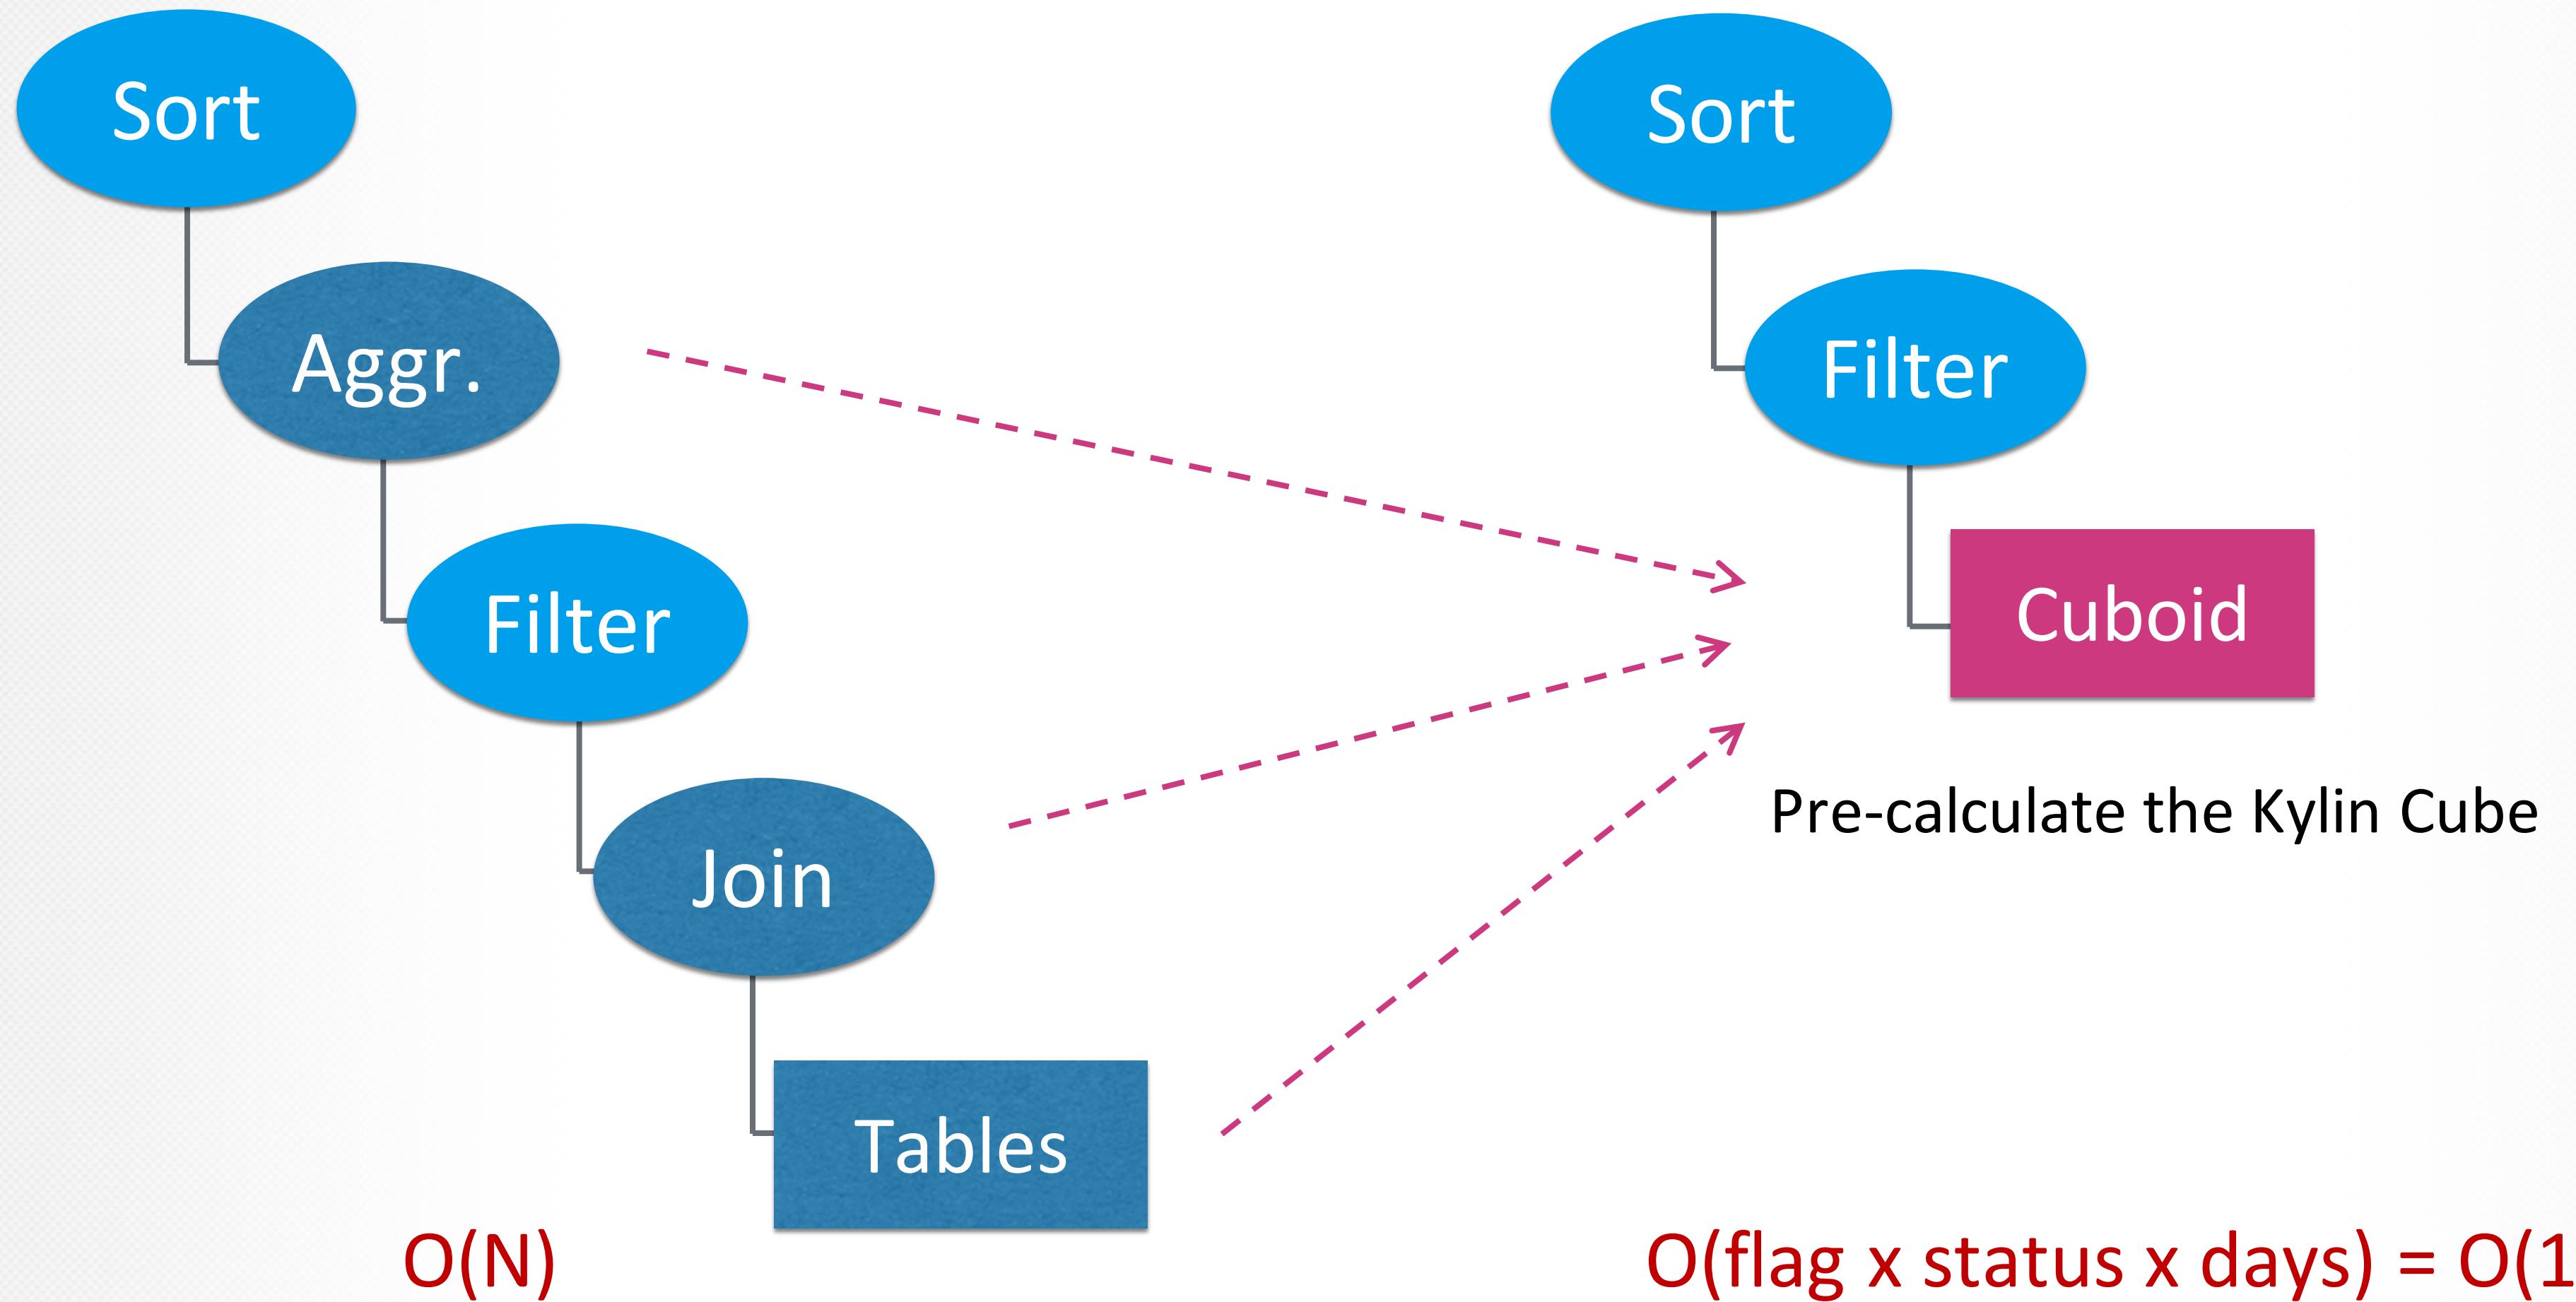

A sample query:

Report revenue by “returnflag” and “orderstatus”

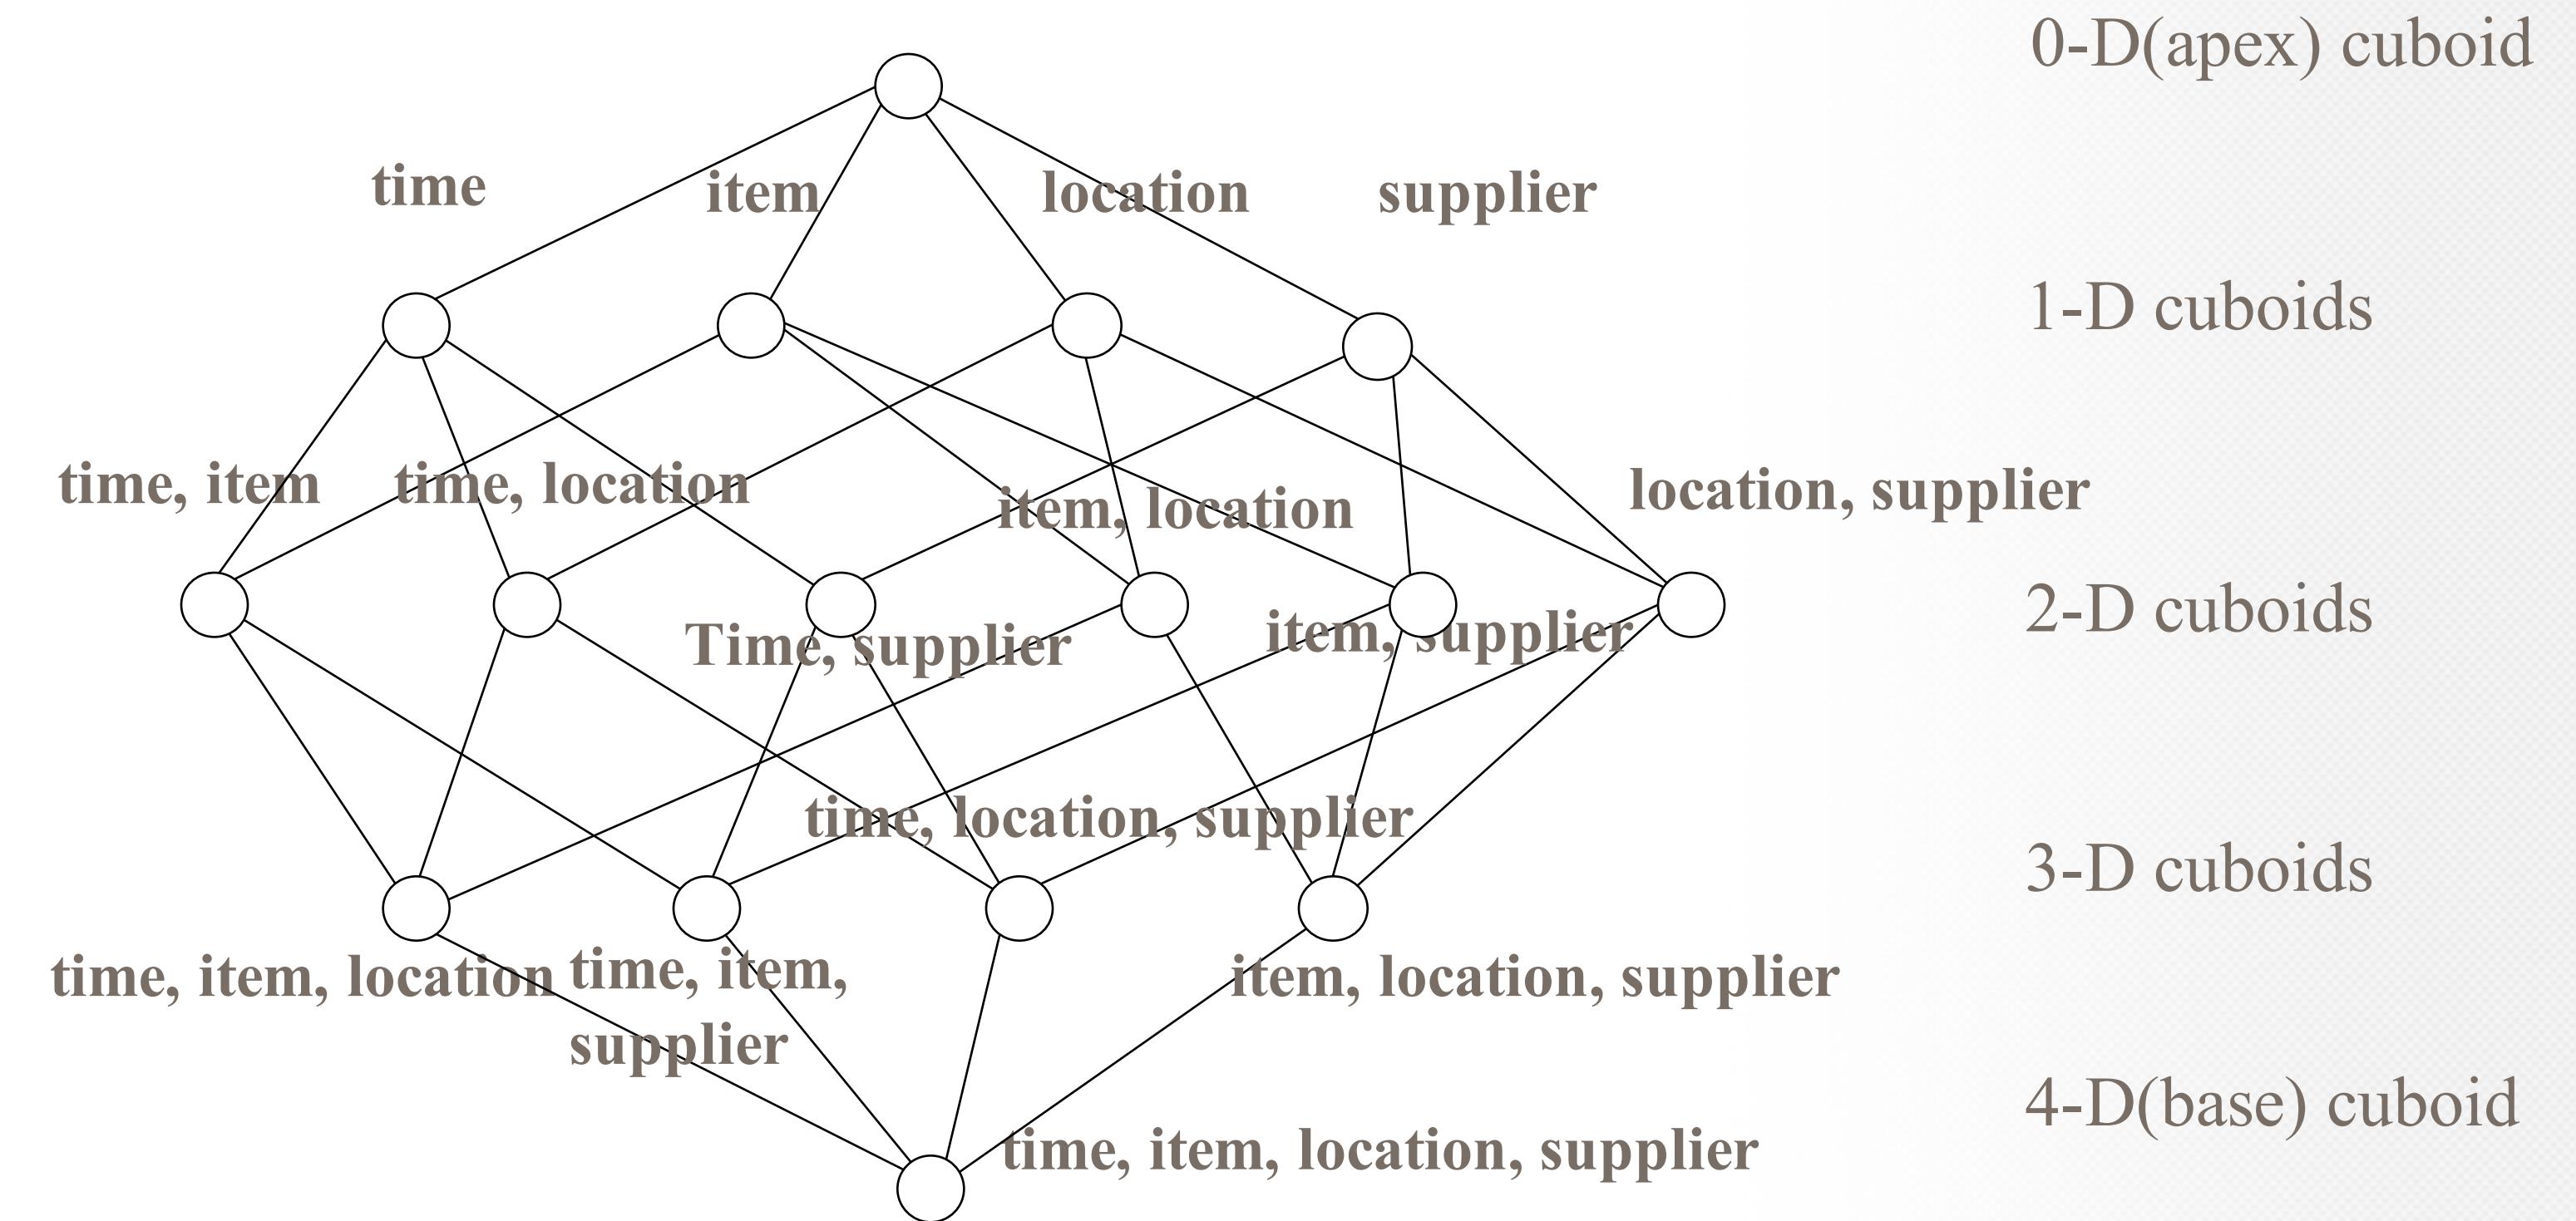

```
select
    l_returnflag,
    o_orderstatus,
    sum(l_quantity) as sum_qty,
    sum(l_extendedprice) as sum_base_price
    ...
from
    v_lineitem
    inner join v_orders on l_orderkey = o_orderkey
where
    l_shipdate <= '1998-09-16'
group by
    l_returnflag,
    o_orderstatus
order by
    l_returnflag,
    o_orderstatus;
```

Kylin为什么快

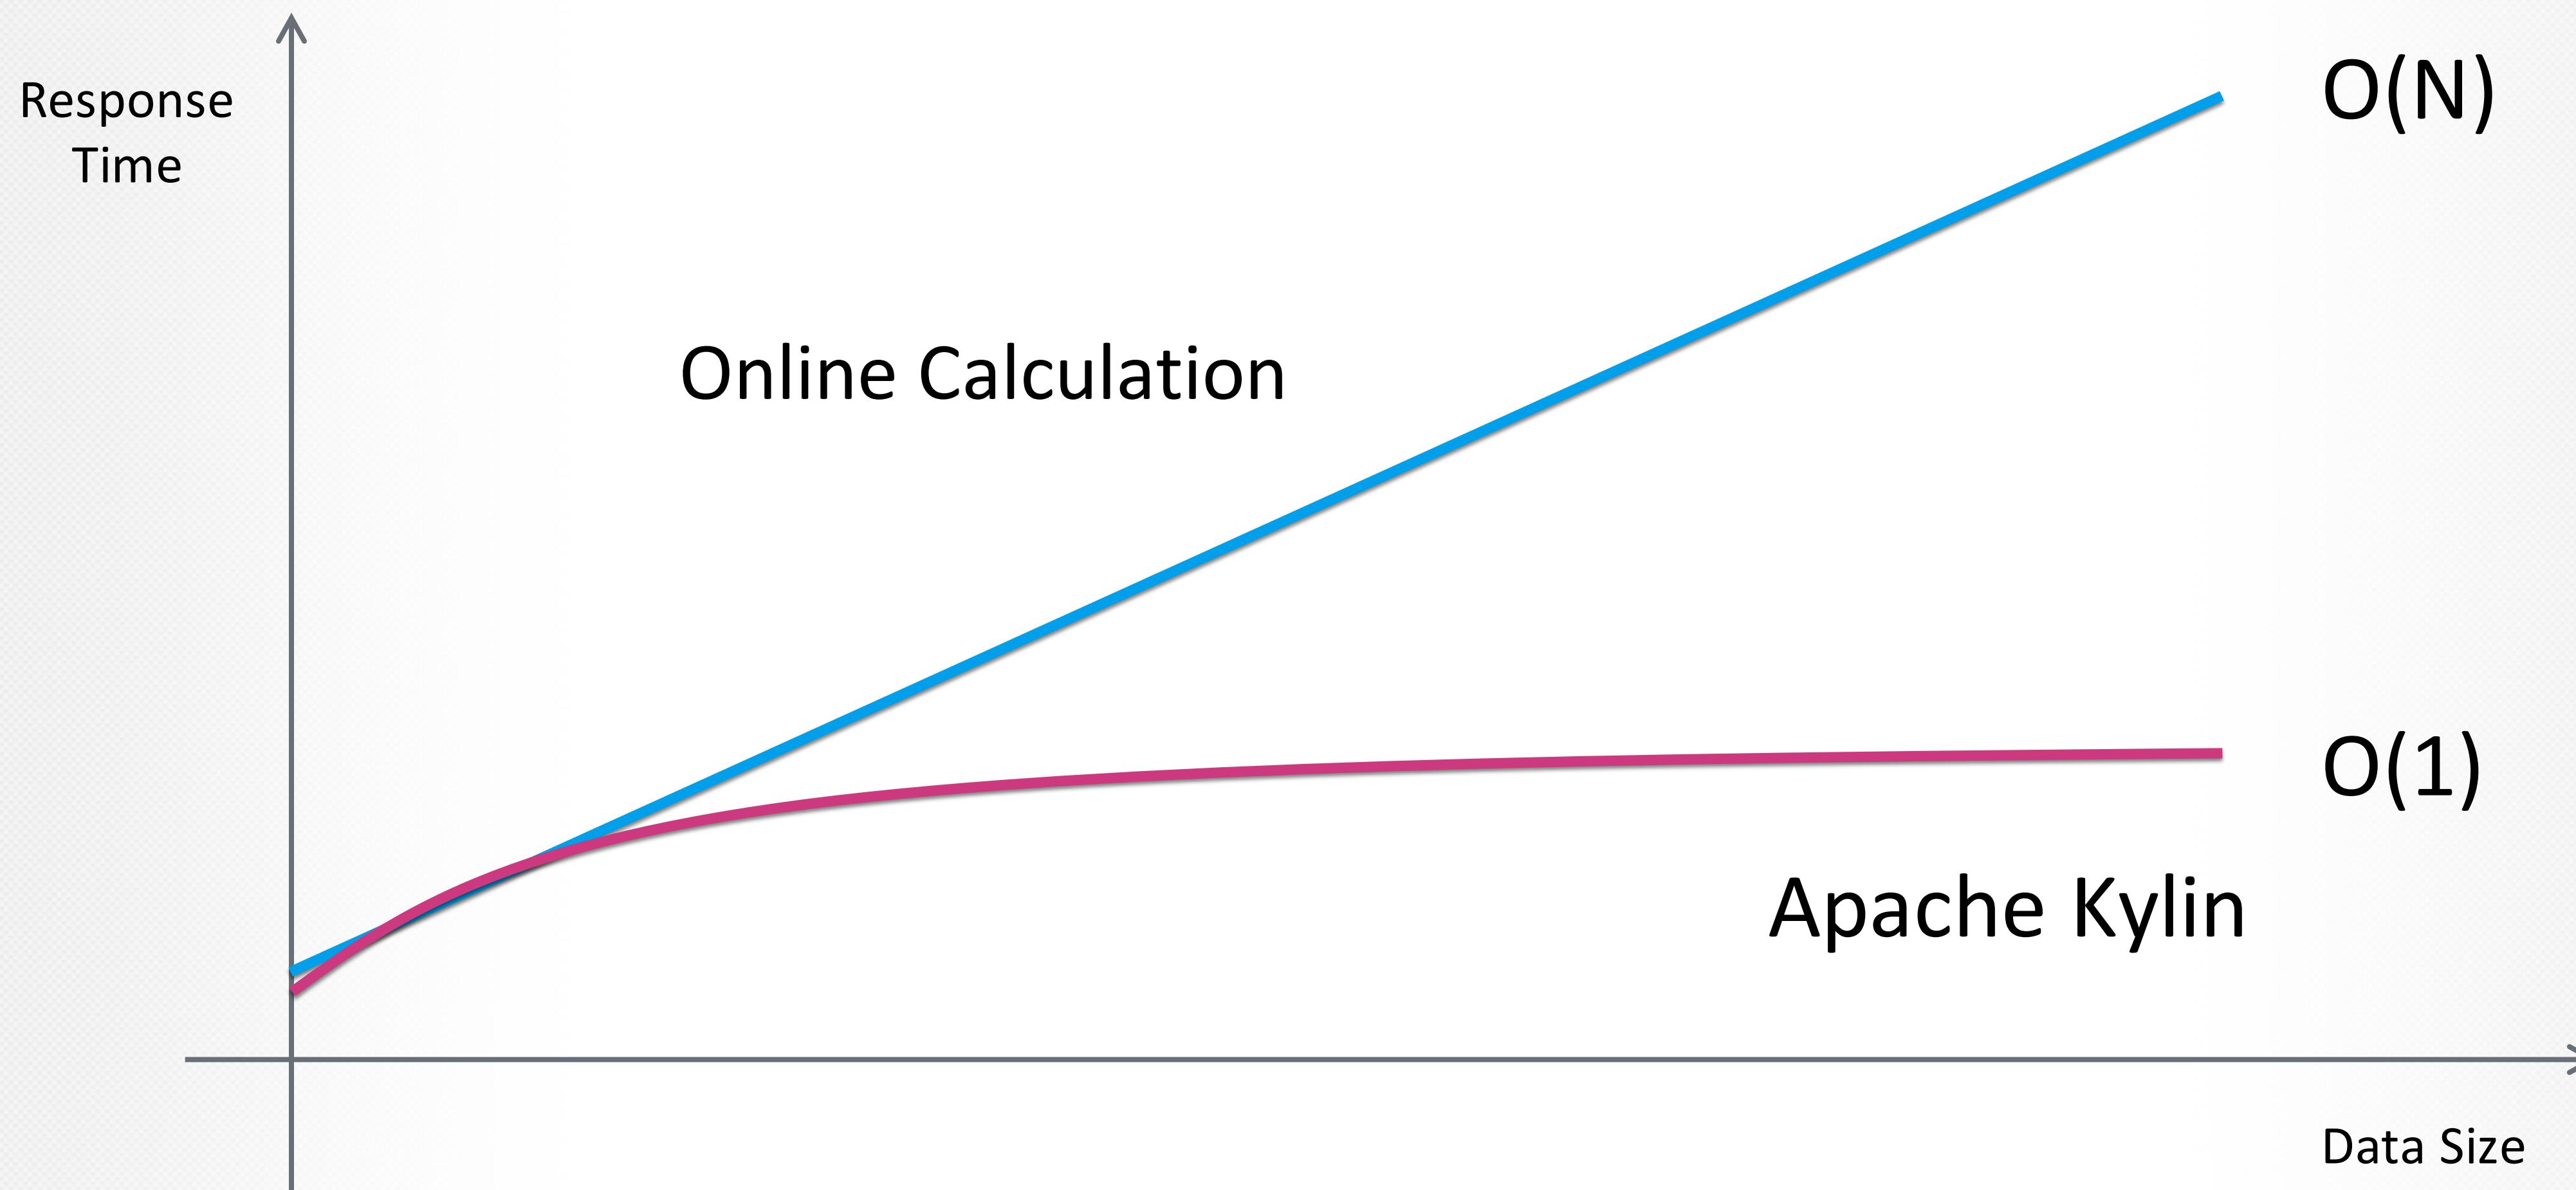

Kylin 关键在于预计算

- 基于cube理论
- Model 和 Cube 定义了预计算的范围
- Build Engine 执行构建任务
- Query Engine 在预计算的结果之上完成查询

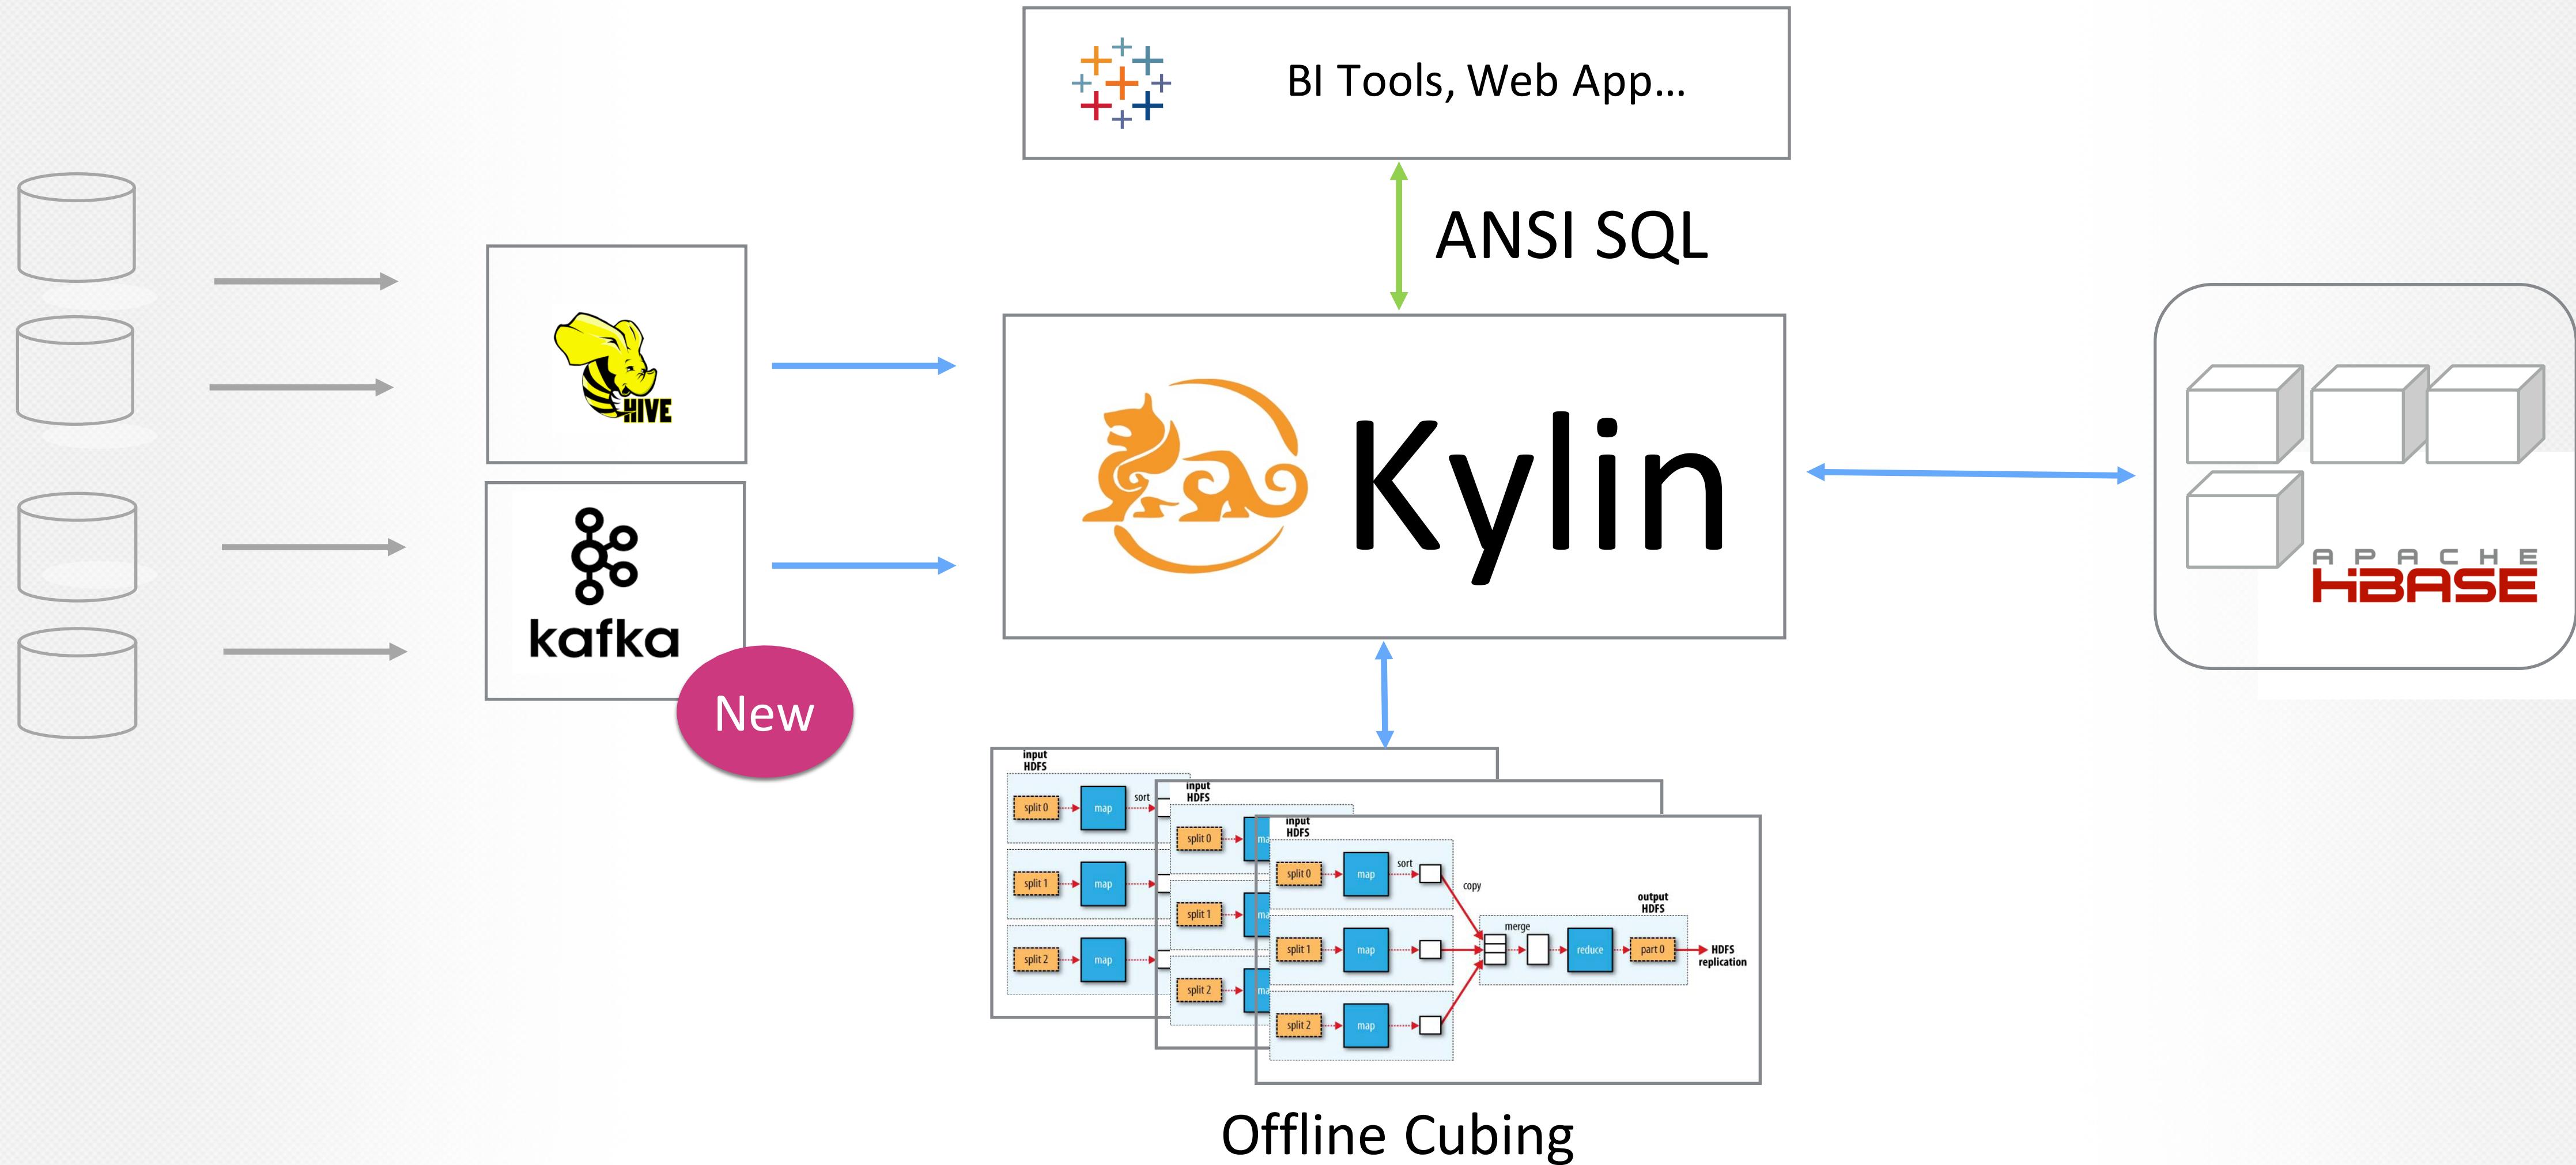

O(1)复杂度

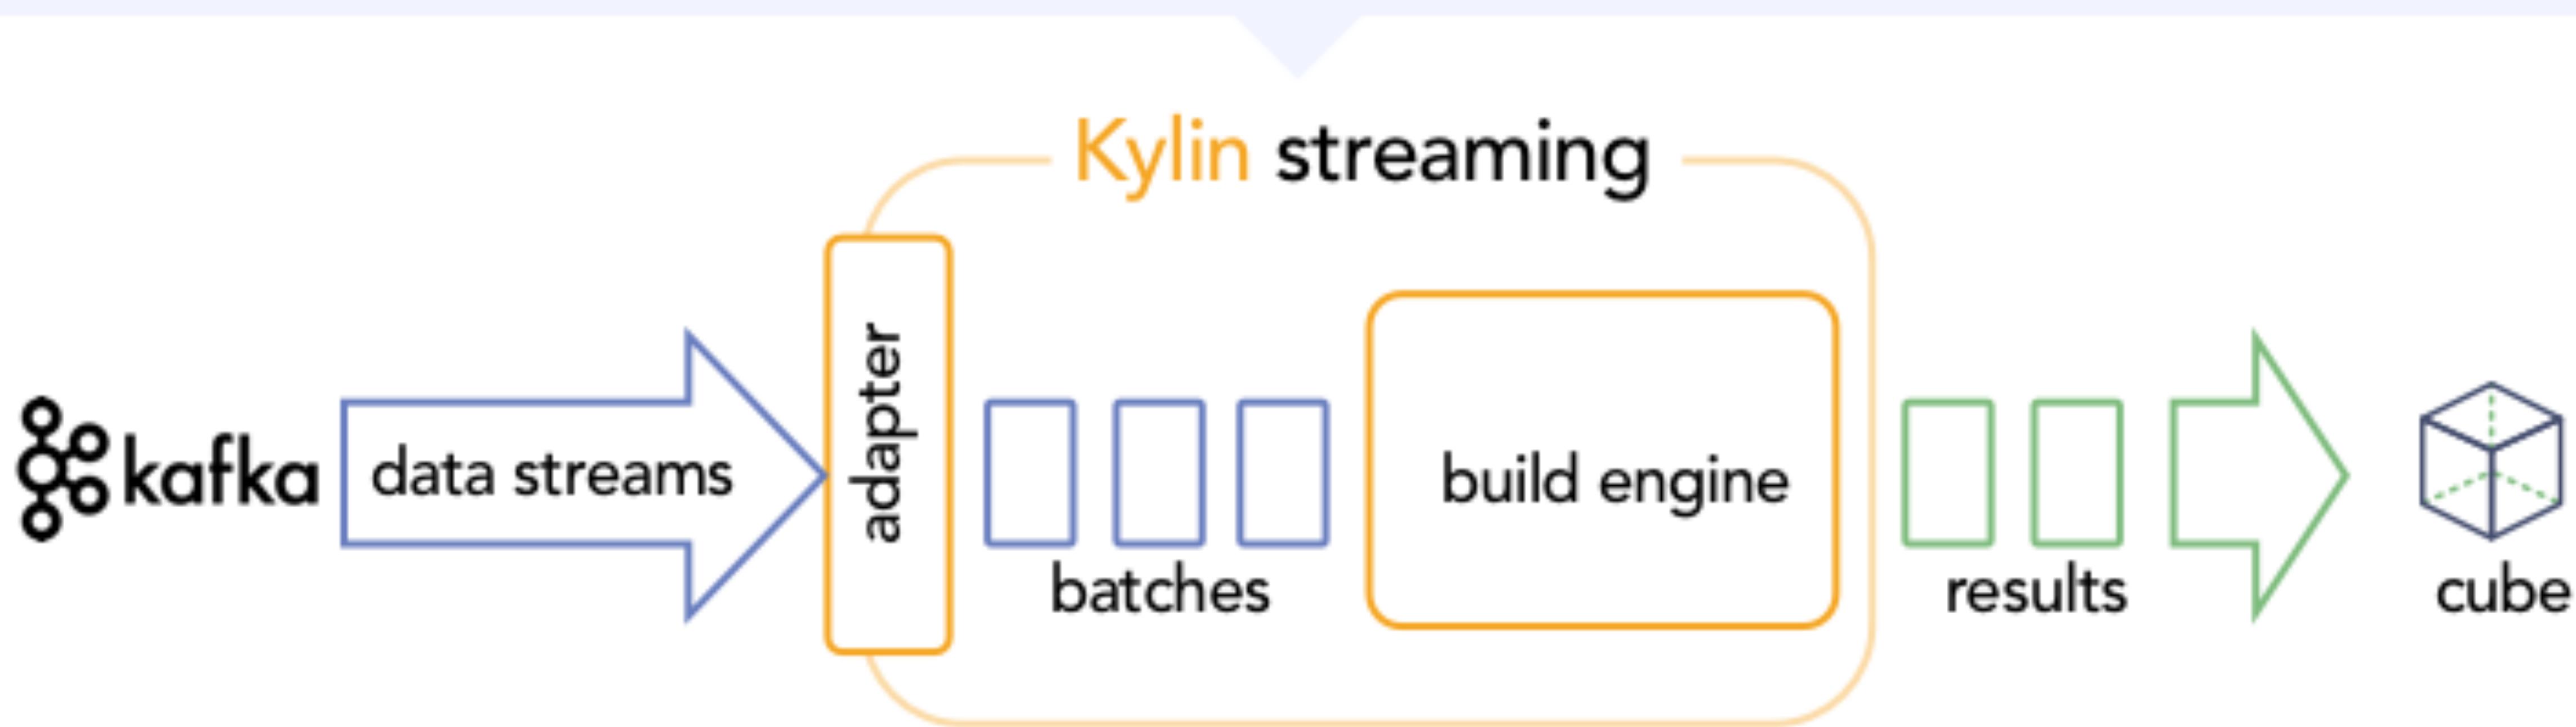

近实时流数据处理

构建分钟级别延迟的cube

New in Kylin 1.6

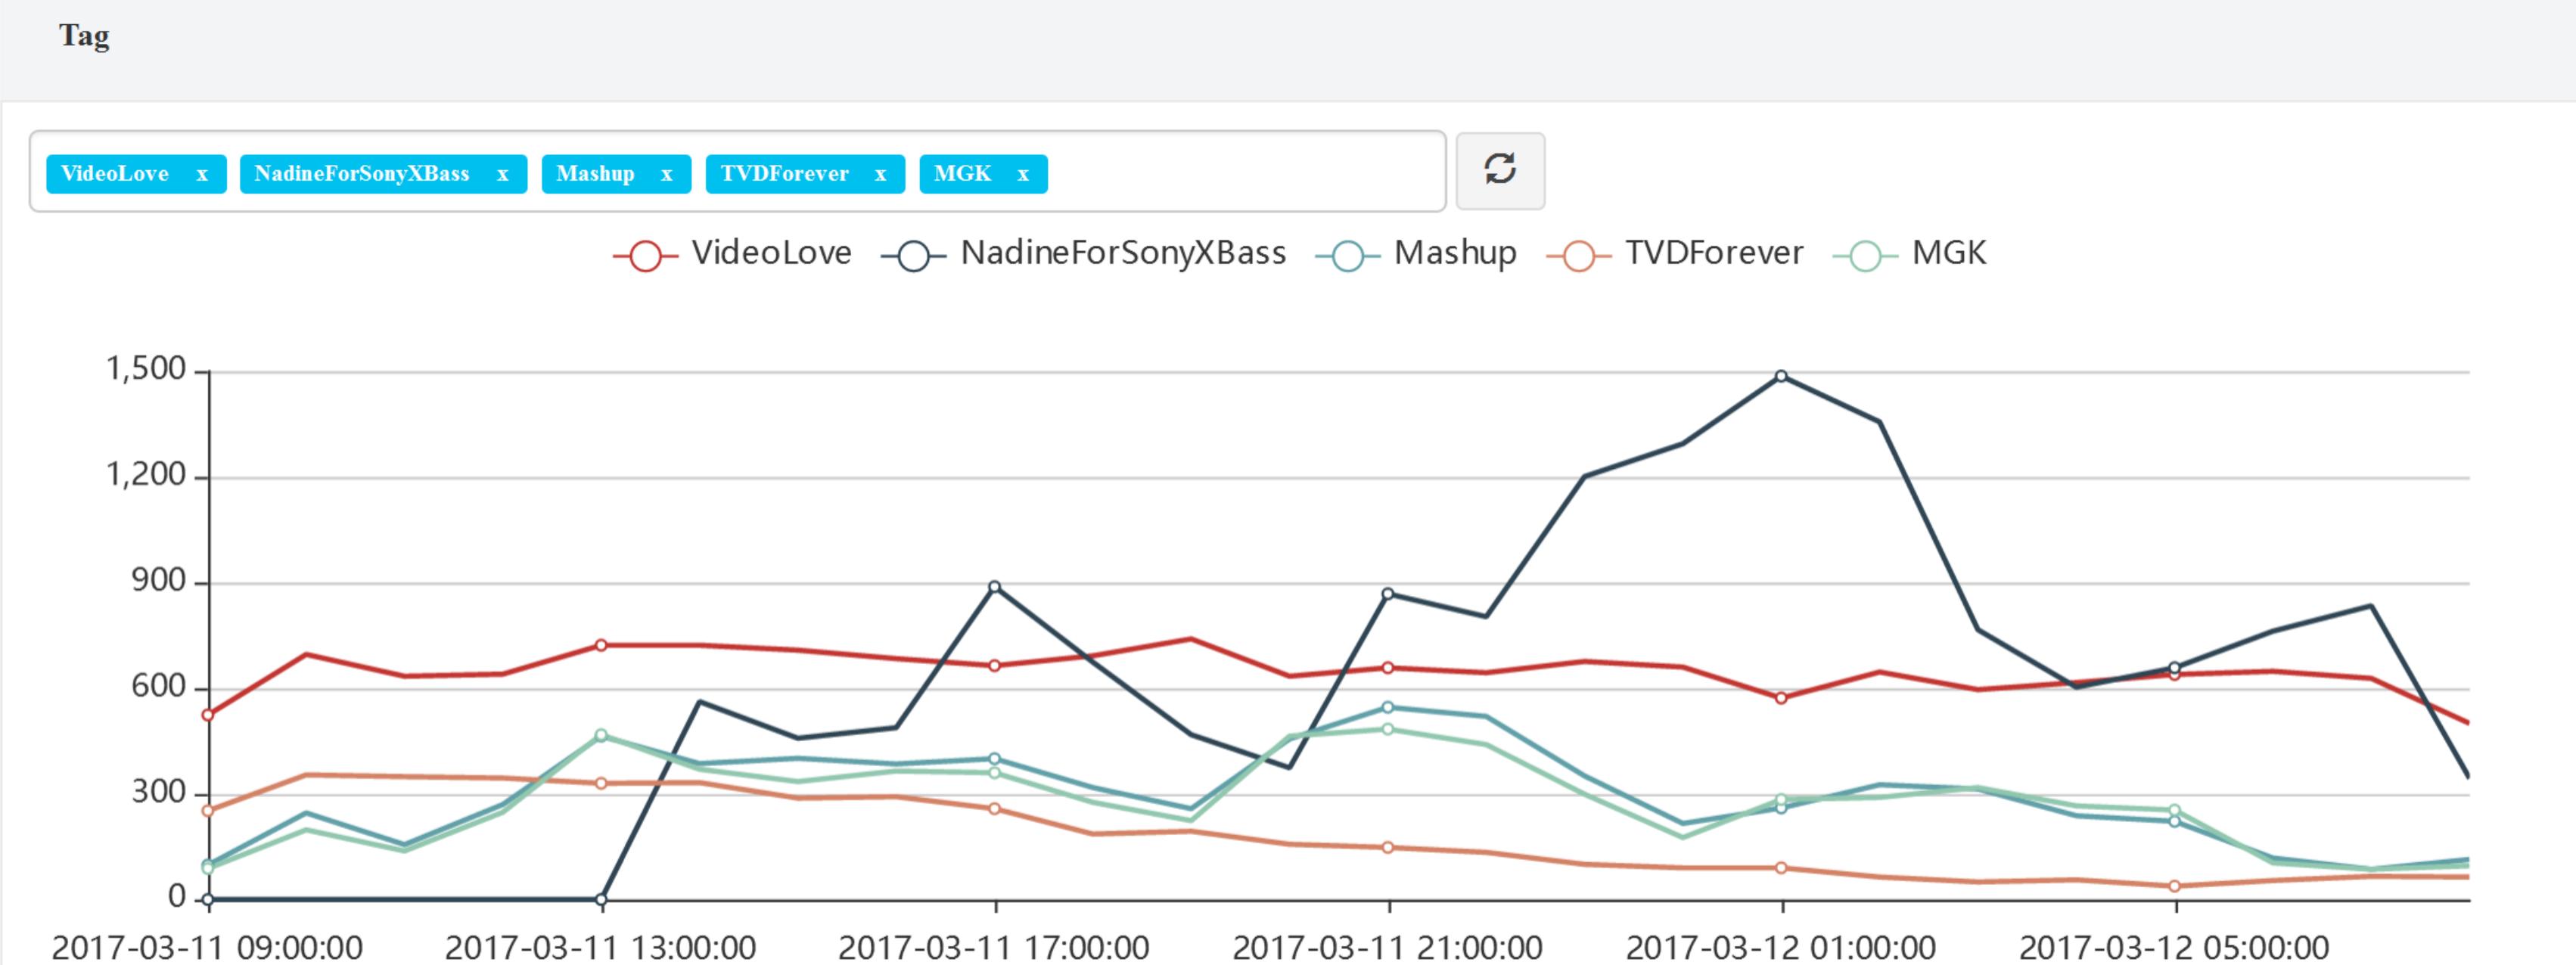

Demo of Twitter Analysis

<http://hub.kyligence.io>

Incremental build triggers every 2 minutes, build finishes in 3 minutes.

- 8-node cluster on AWS, 3 Kafka brokers
- Twitter sample feed, 10+ K messages per second
- Cube has 9 dimensions and 3 measures
- 2 jobs running at the same time

Jobs in: LAST ONE WEEK					
Cube	Progress	Last Modified Time	Duration	Actions	
embedded_cube	<div style="width: 73.68%;">73.68%</div>	2016-10-10 21:52:28 PST	1.65 mins	Action ▾	
embedded_cube	<div style="width: 5%;">5%</div>	2016-10-10 21:52:23 PST	0.23 mins	Action ▾

Spark Cubing

减少一半的构建时间

Layered Cubing

标准的构建算法: Layered Cubing

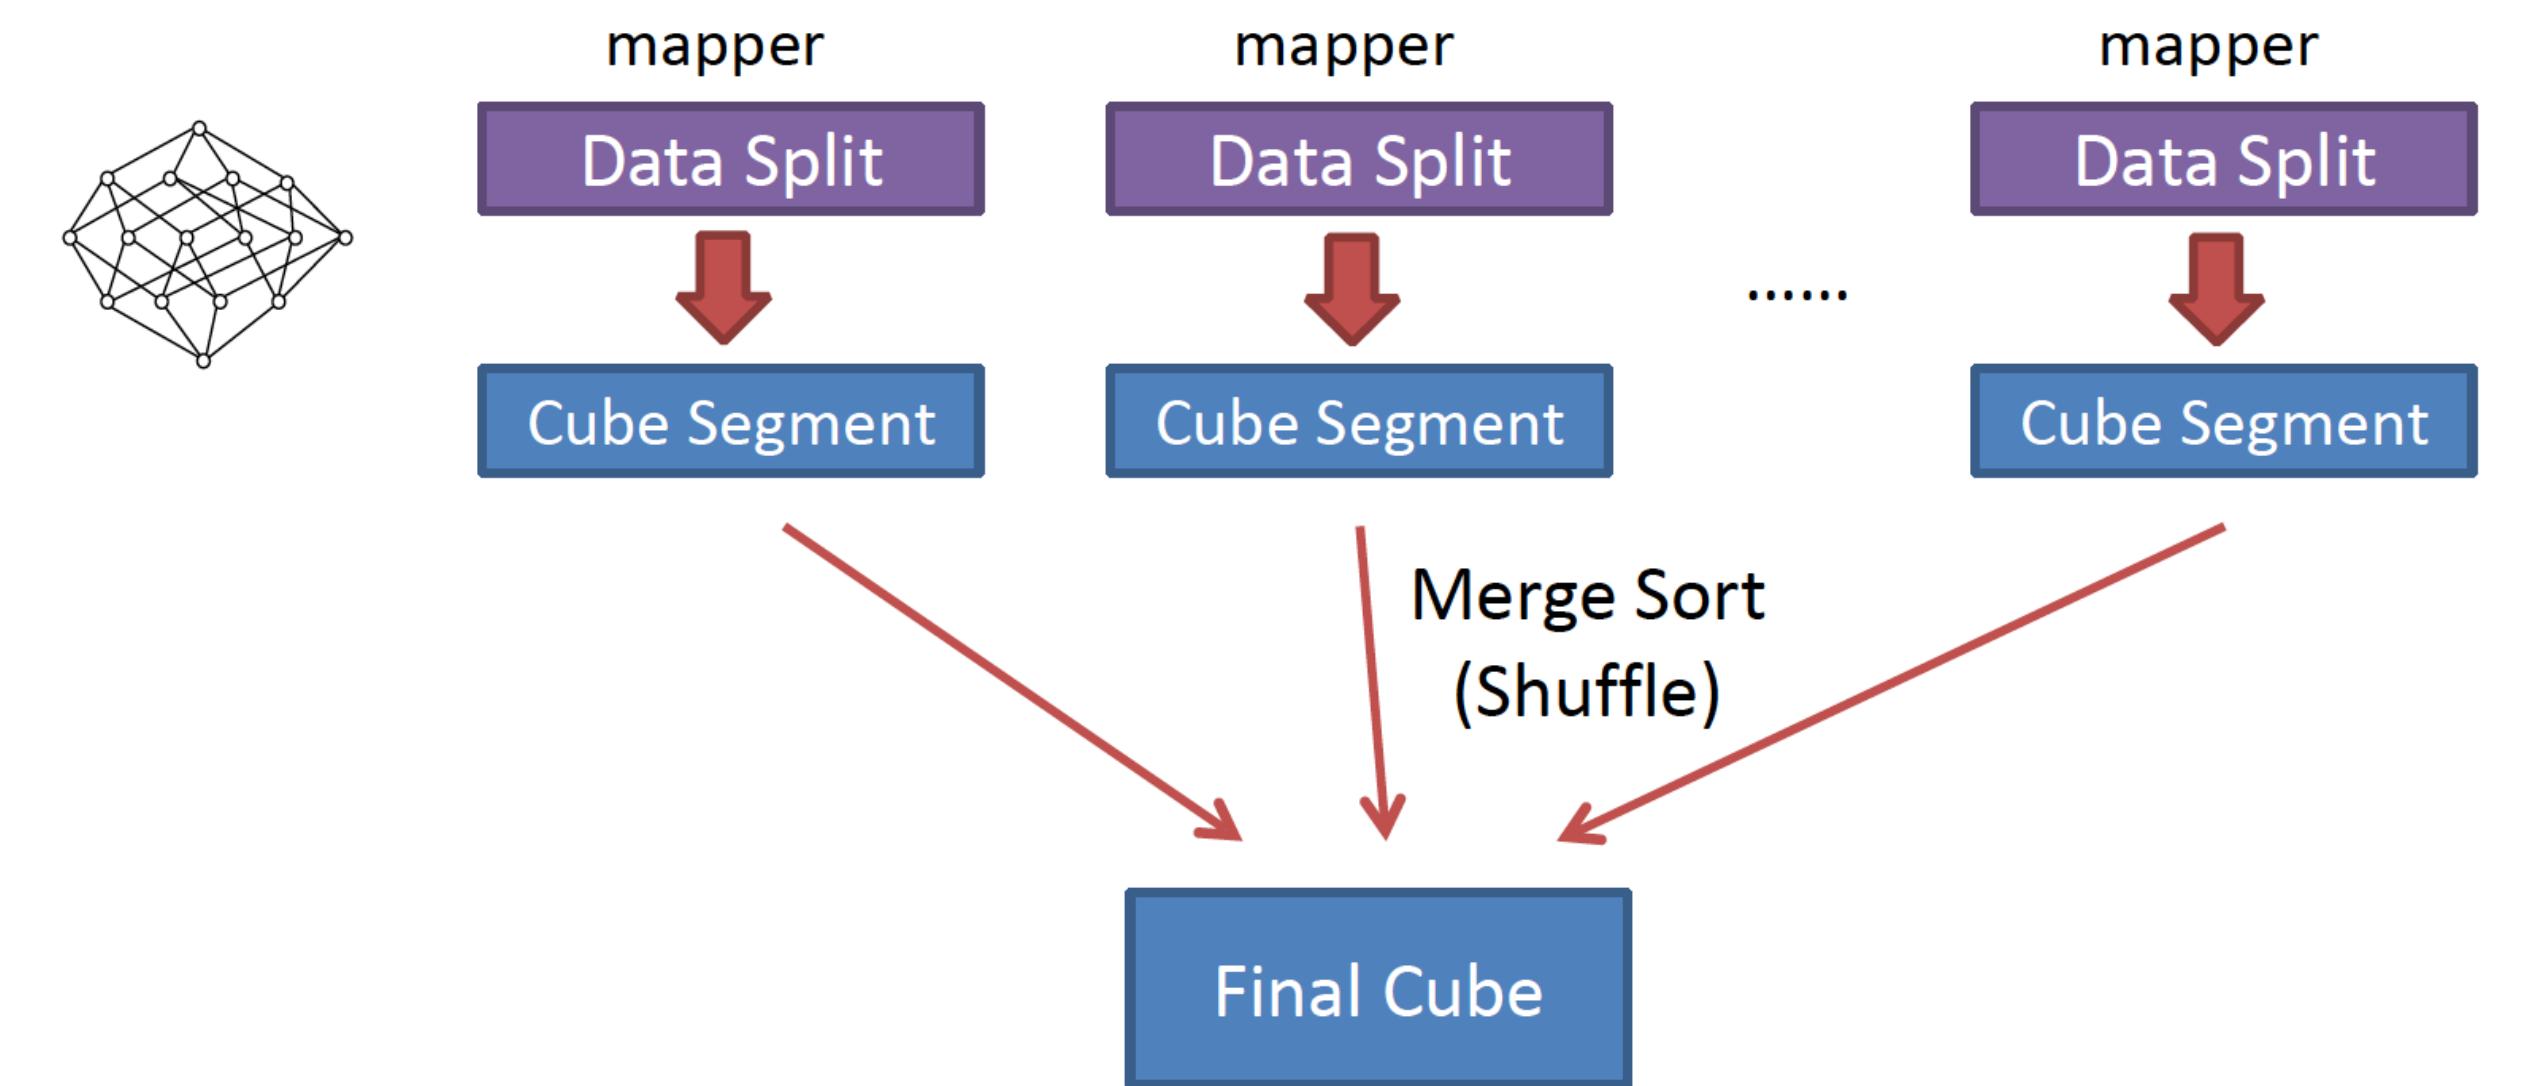

- 启动多轮MR任务
- 将大型shuffle切分到多个stage
- 稳定，但是在构建时间上并不是最优的

In-memory Cubing

In-memory Cubing是对Layered Cubing的强力补充

- 在某些条件下触发
- 并不适用于所有场景
- 一旦被触发，往往拥有更好性能

Cubing with MR 总结

比较稳定

Layered Cubing在某些场景下性能都有待提高

In-mem Cubing适用场景有限

社区迫不及待地想要尝试使用其他技术来加速cubing

Apache Spark介绍

Apache Spark is an open-source cluster-computing framework, which provides programmers with an application programming interface centered on a data structure called RDD.

Spark was developed in response to limitations in the MapReduce cluster computing paradigm.

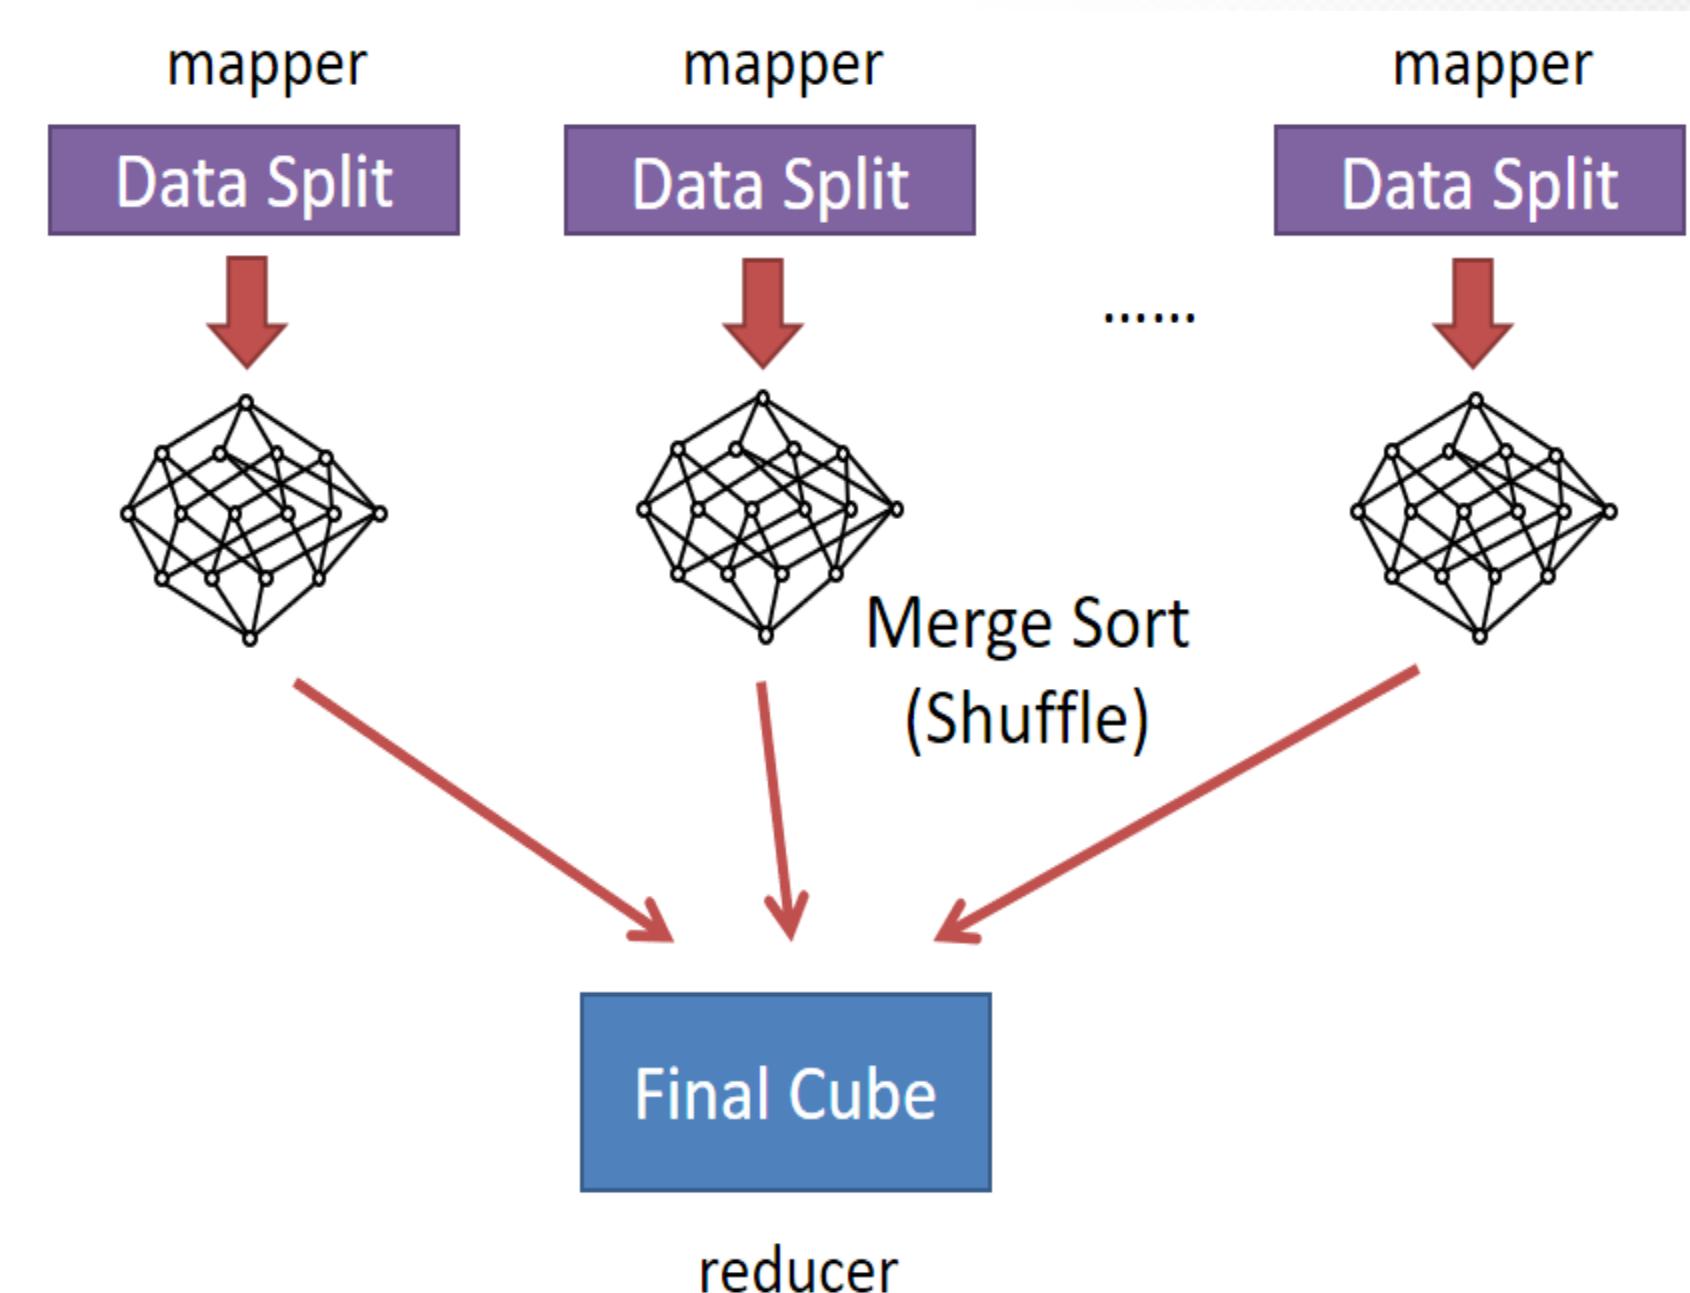

Spark runs on Hadoop, Mesos, standalone, or in the cloud. It can access diverse data sources including HDFS, Cassandra, HBase, and S3.

Spark Cubing:一次失败的尝试

Kylin 1.5曾经尝试使用过Spark Cubing，但是从未正式发布

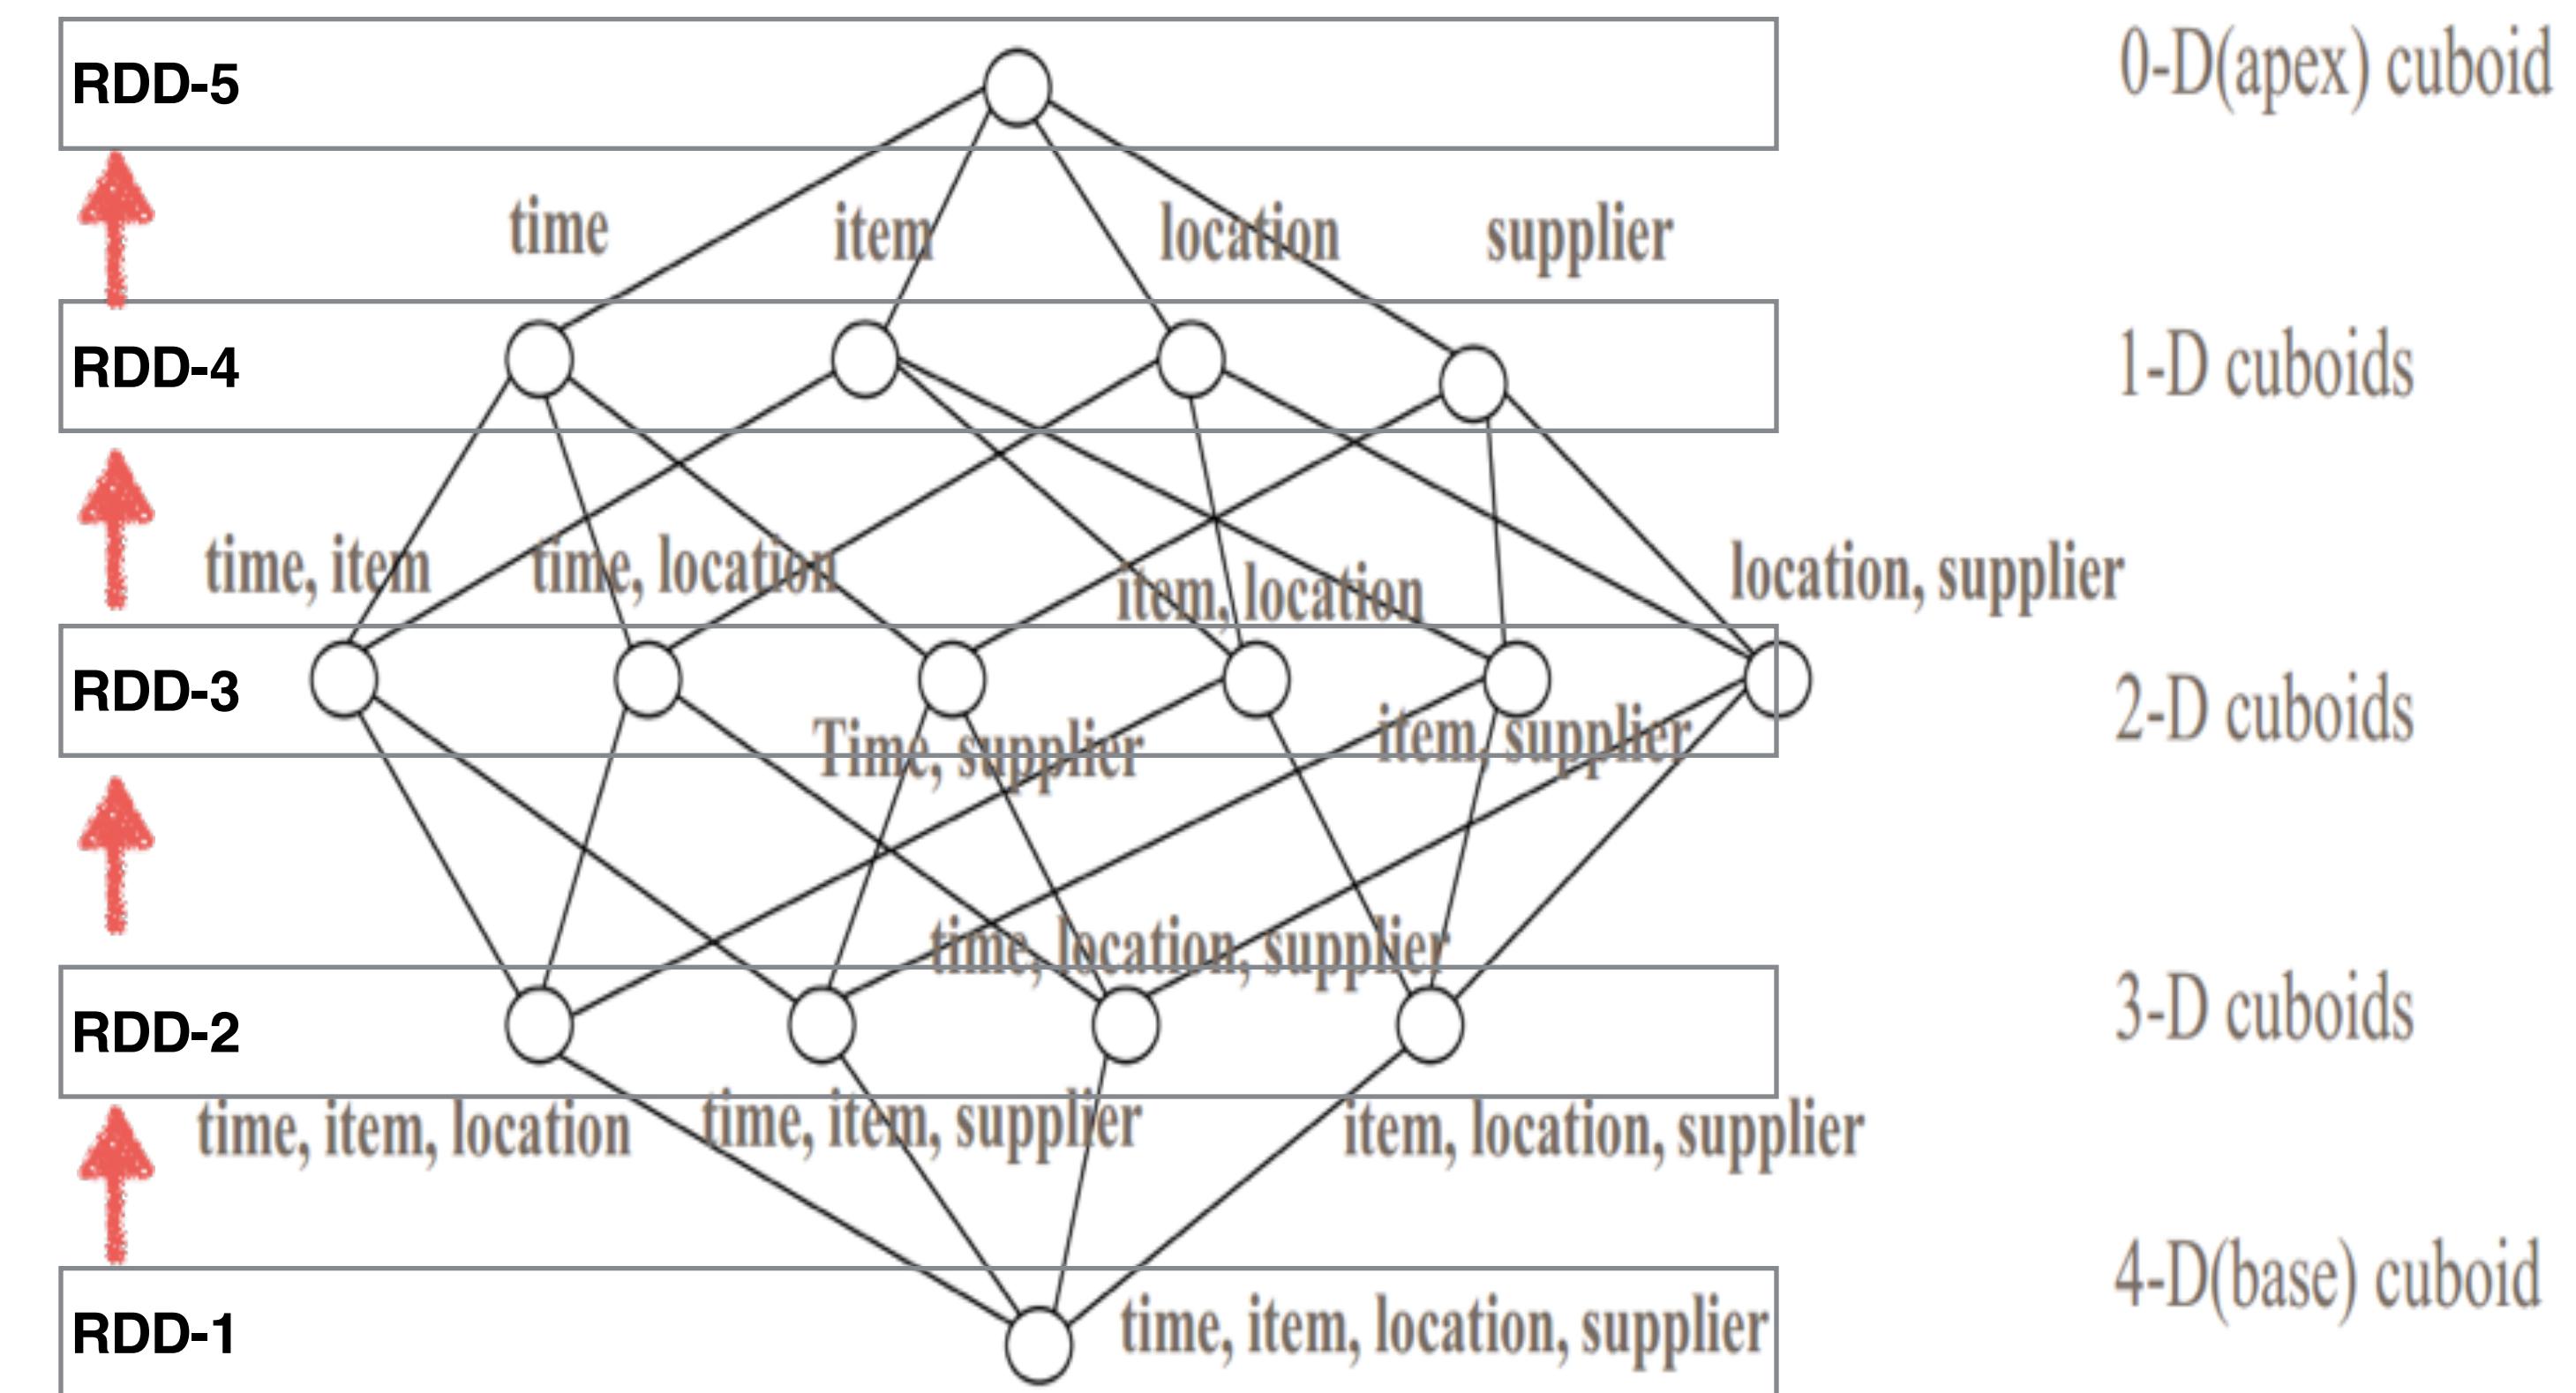

- 它只是简单地将In-memory Cubing移植到Spark上
- 使用一轮RDD转换计算整个cube
- 并未观察到明显改进
- Spark 计算方式与MR并无明显区别

Spark Cubing in 2.0

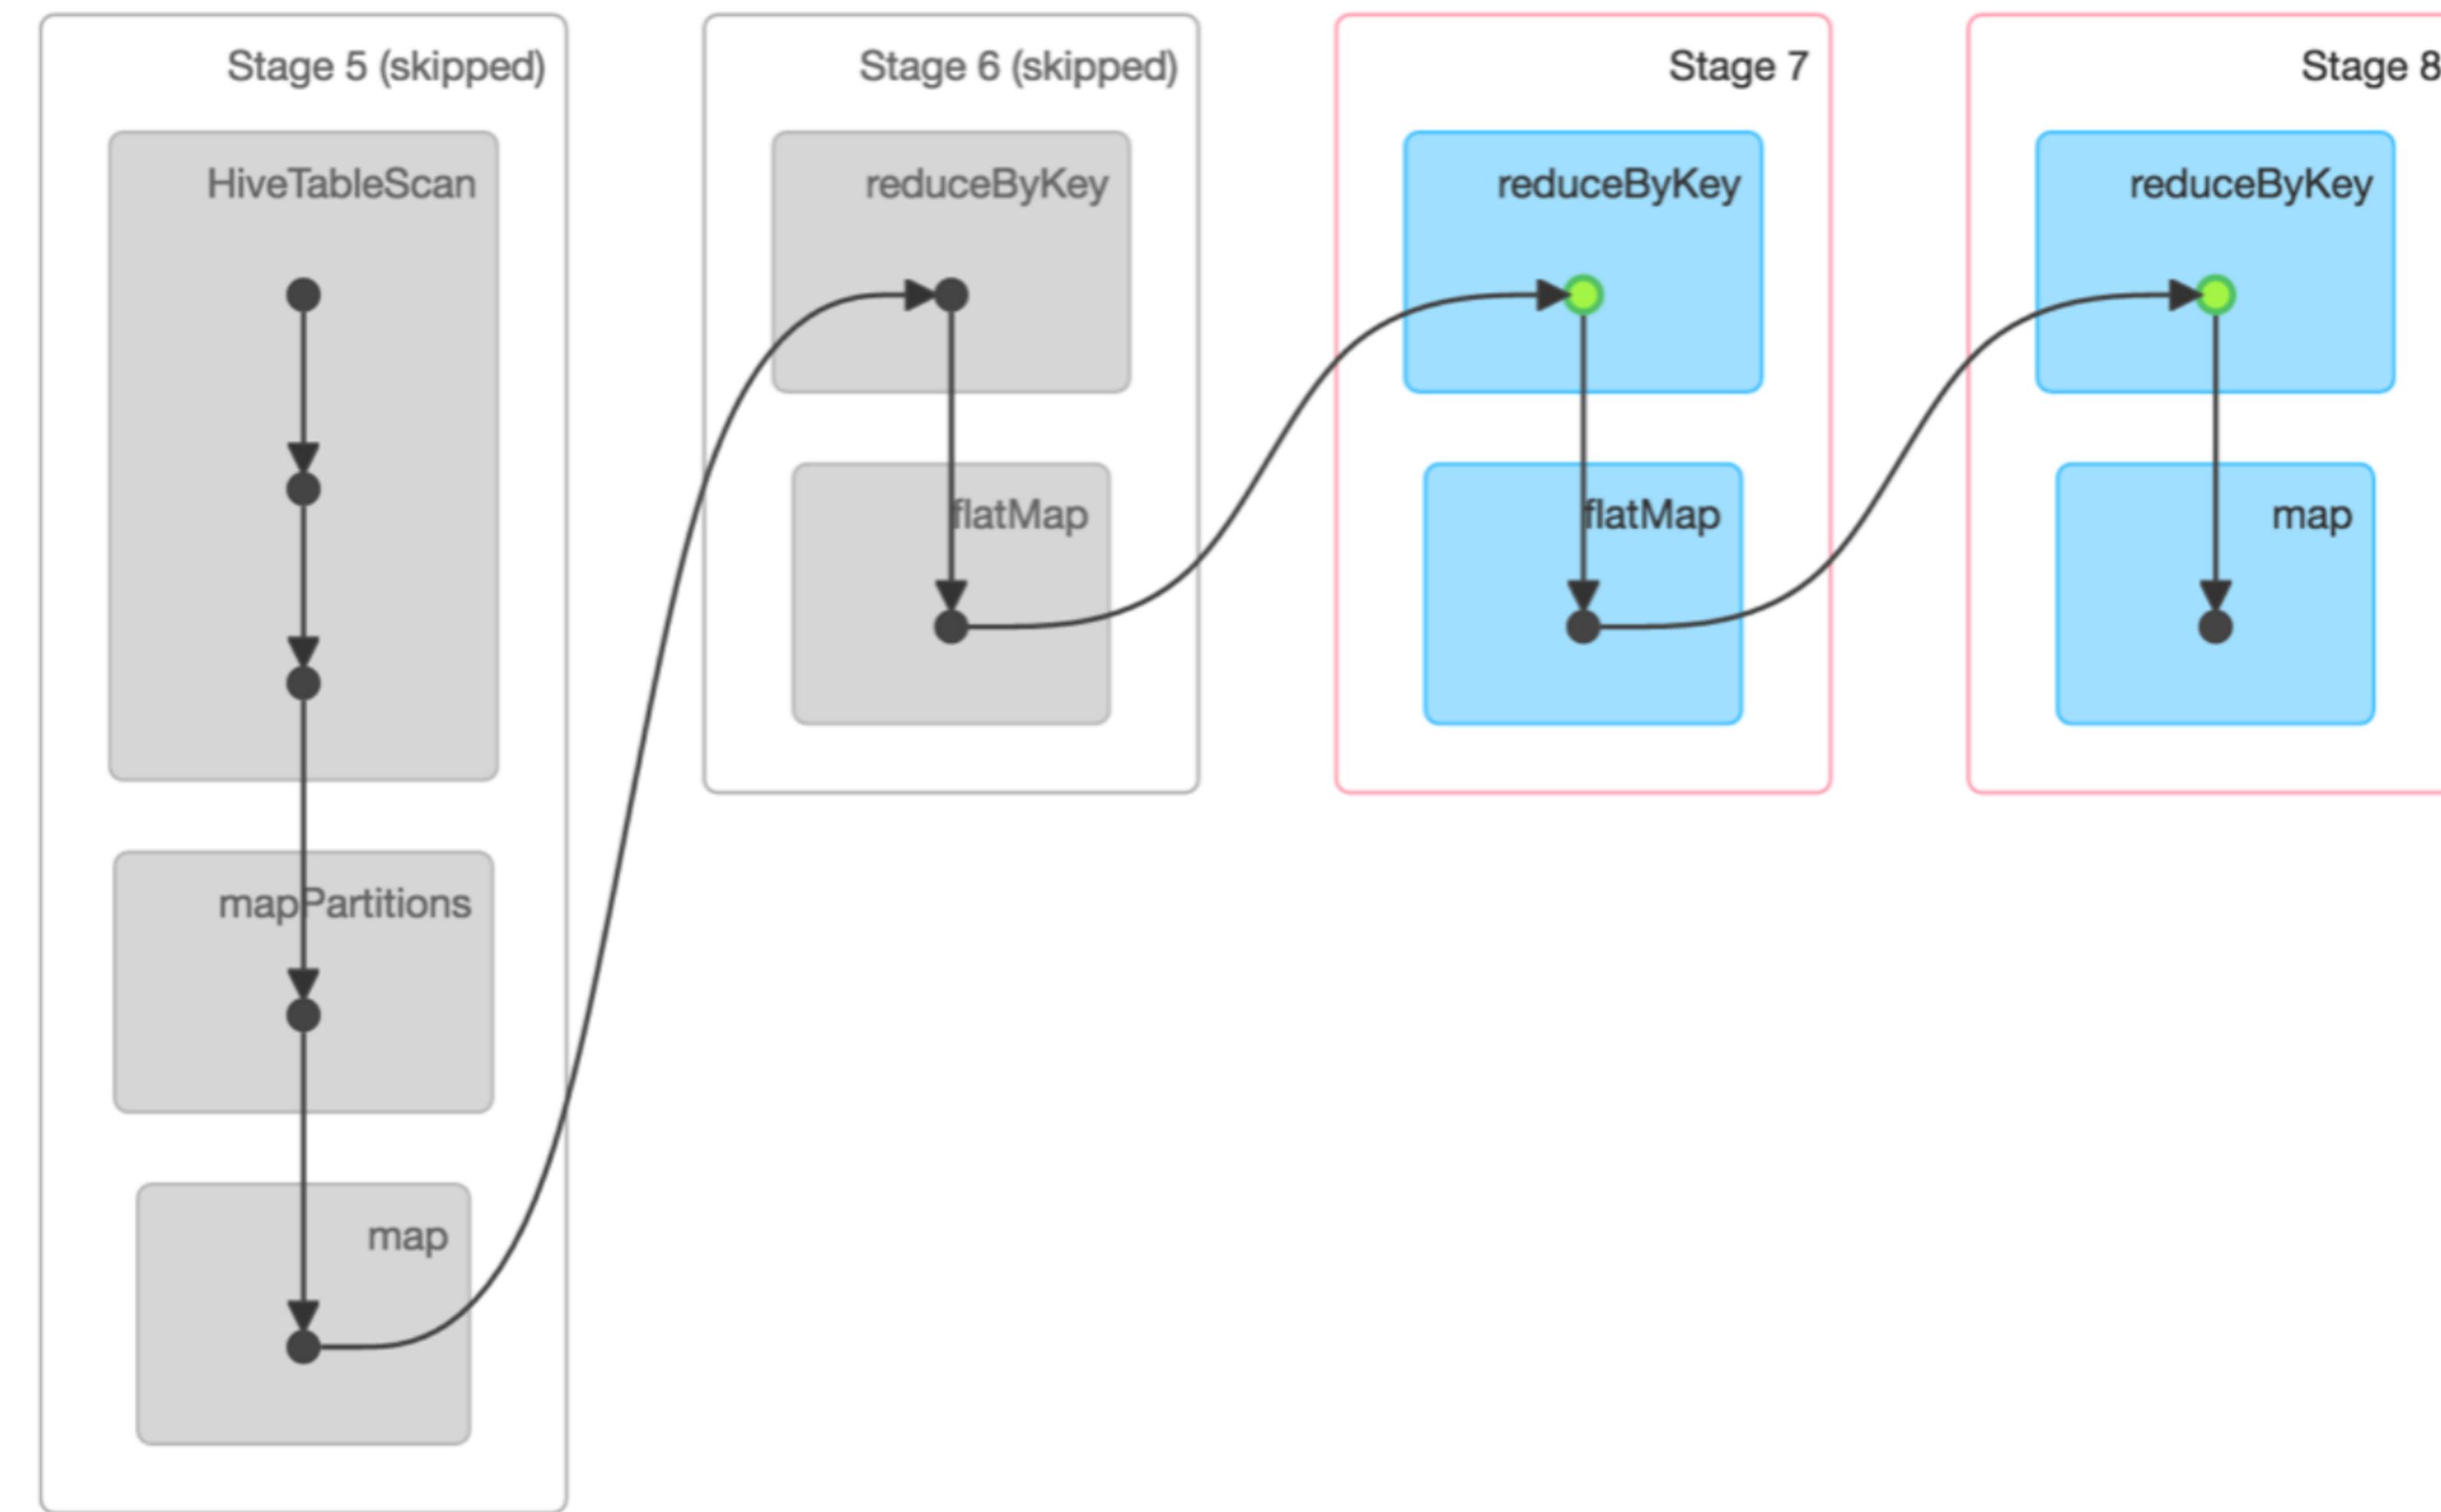

Kylin 2.0 基于Layered Cubing 算法重新打造了Spark Cubing

- 每一层的cuboid视作一个RDD
- 父亲RDD被尽可能cache到内存
- RDD 被导出到sequence file,
- 通过将 “map” 替换为“flatMap”，以及把“reduce” 替换为 “reduceByKey”，可以复用大部分代码

计算第三层cuboid的DAG

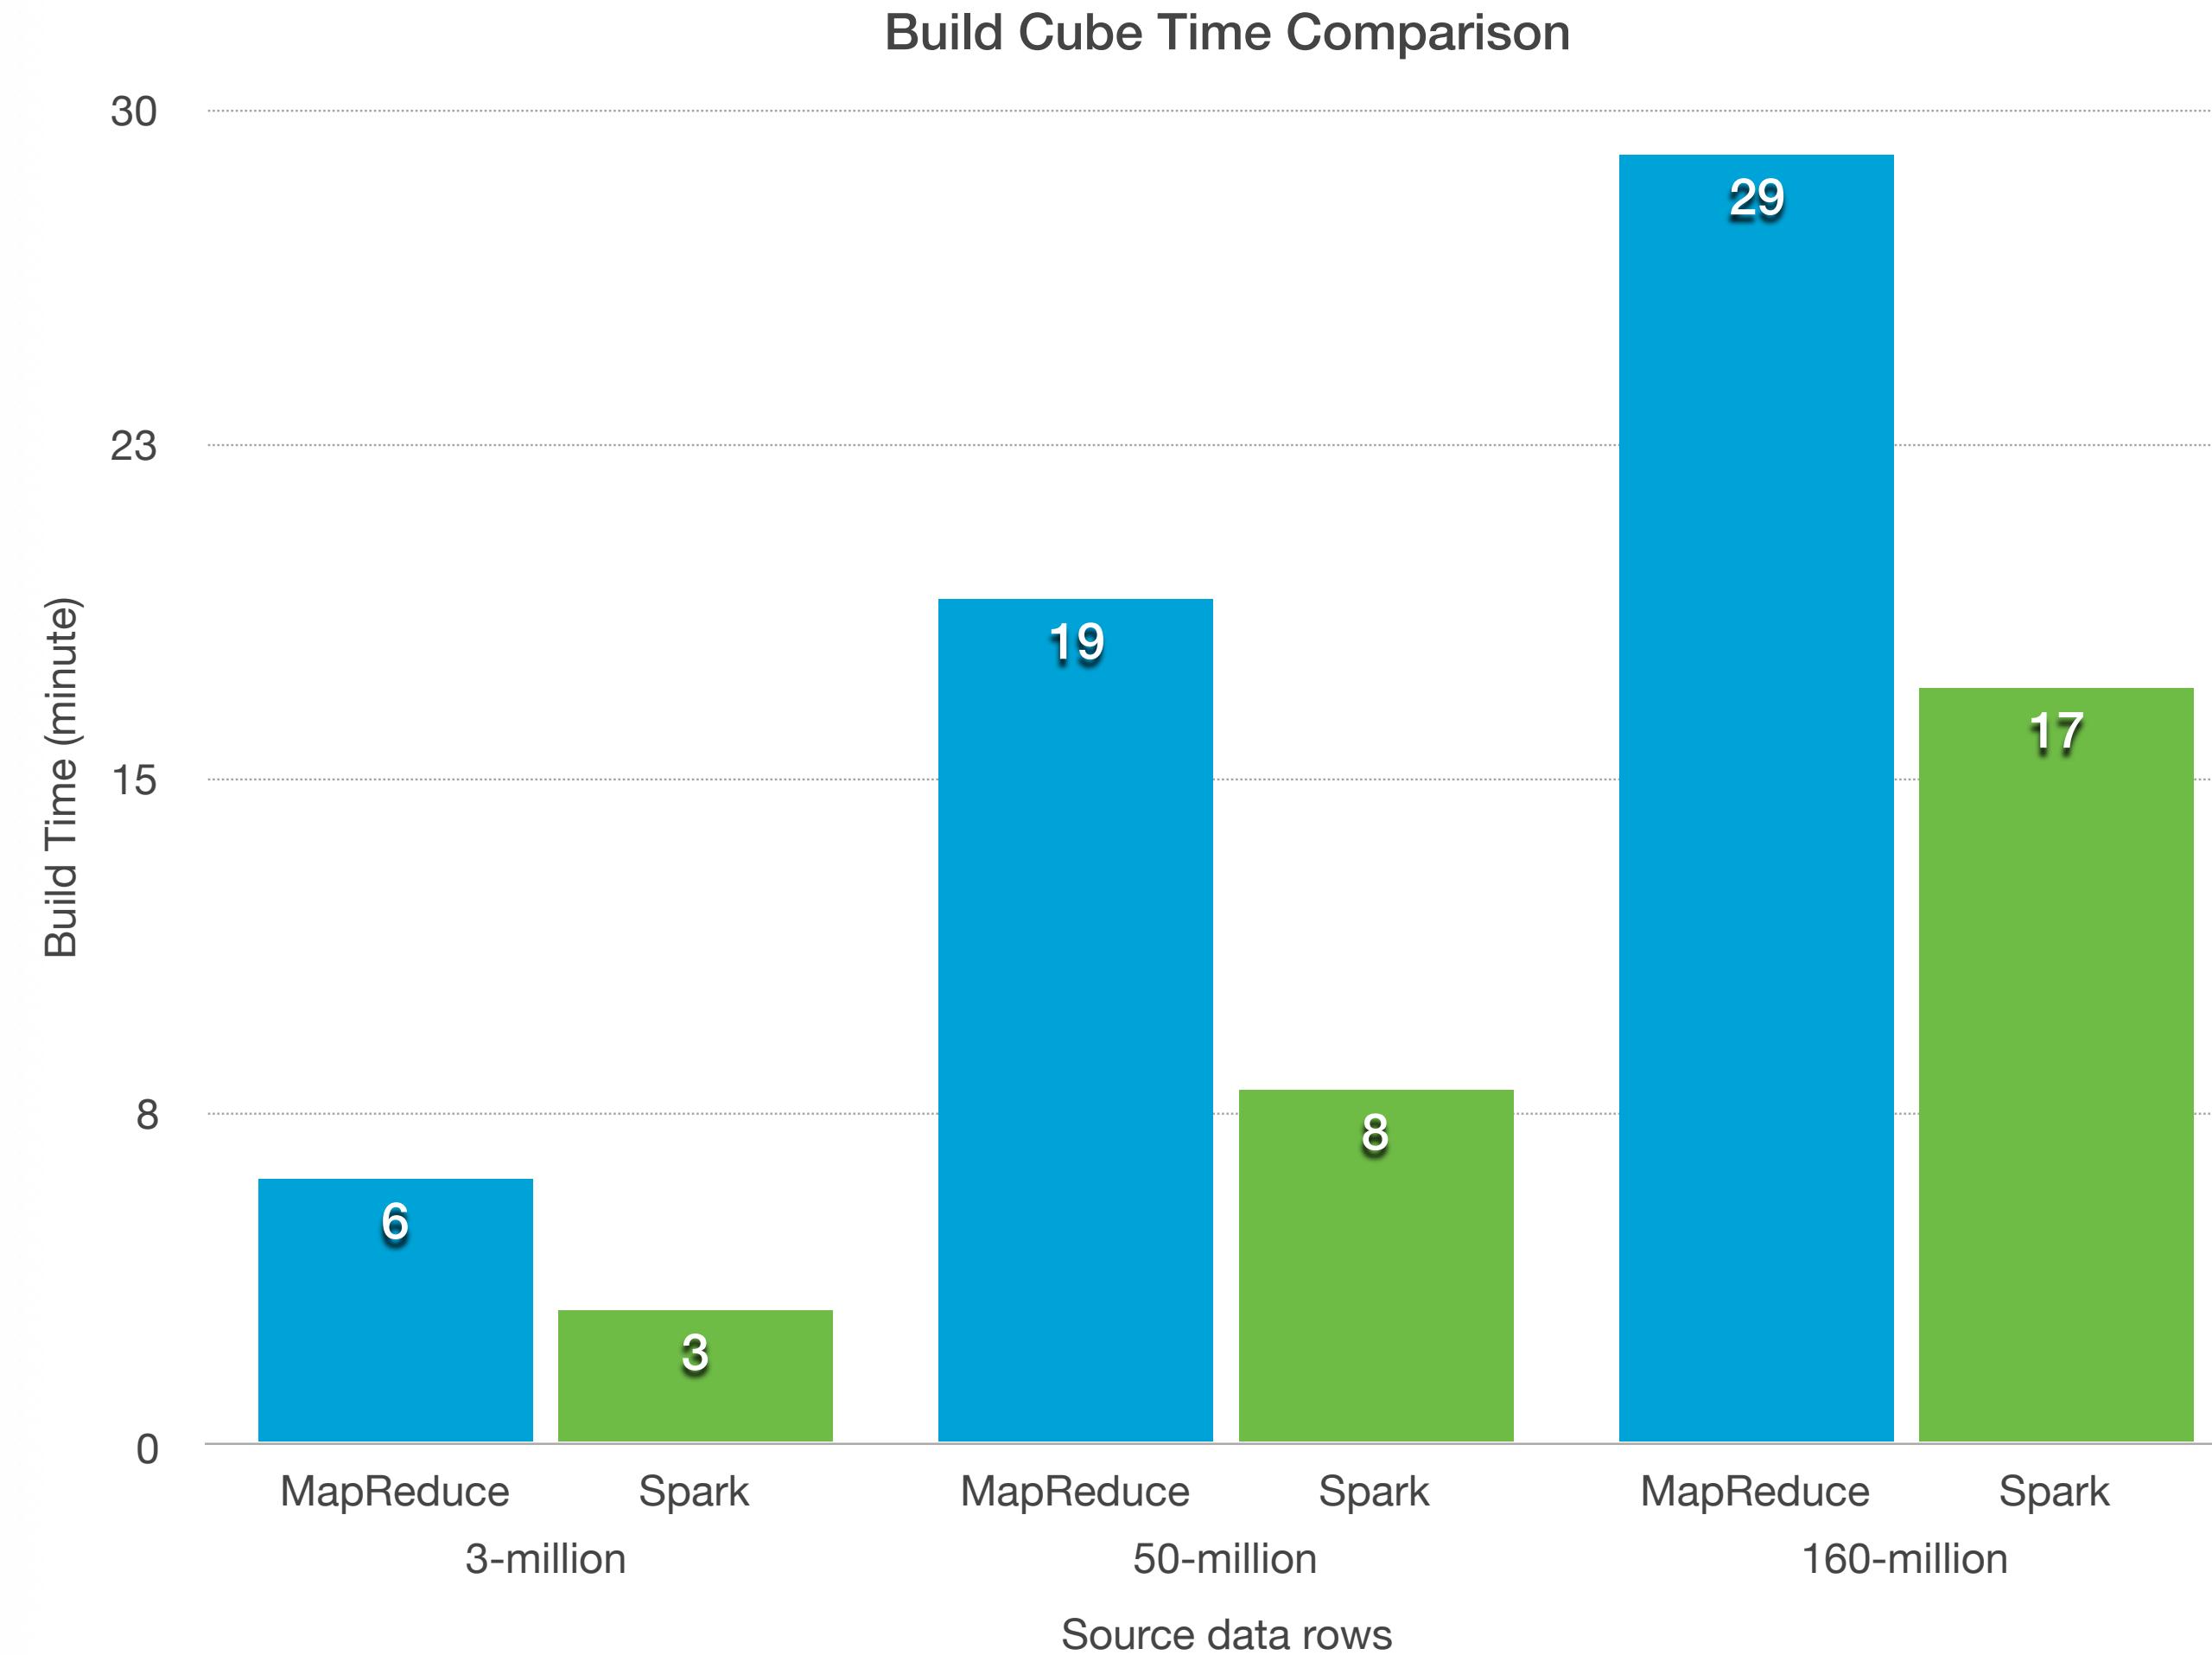

▼ DAG Visualization

Performance Test

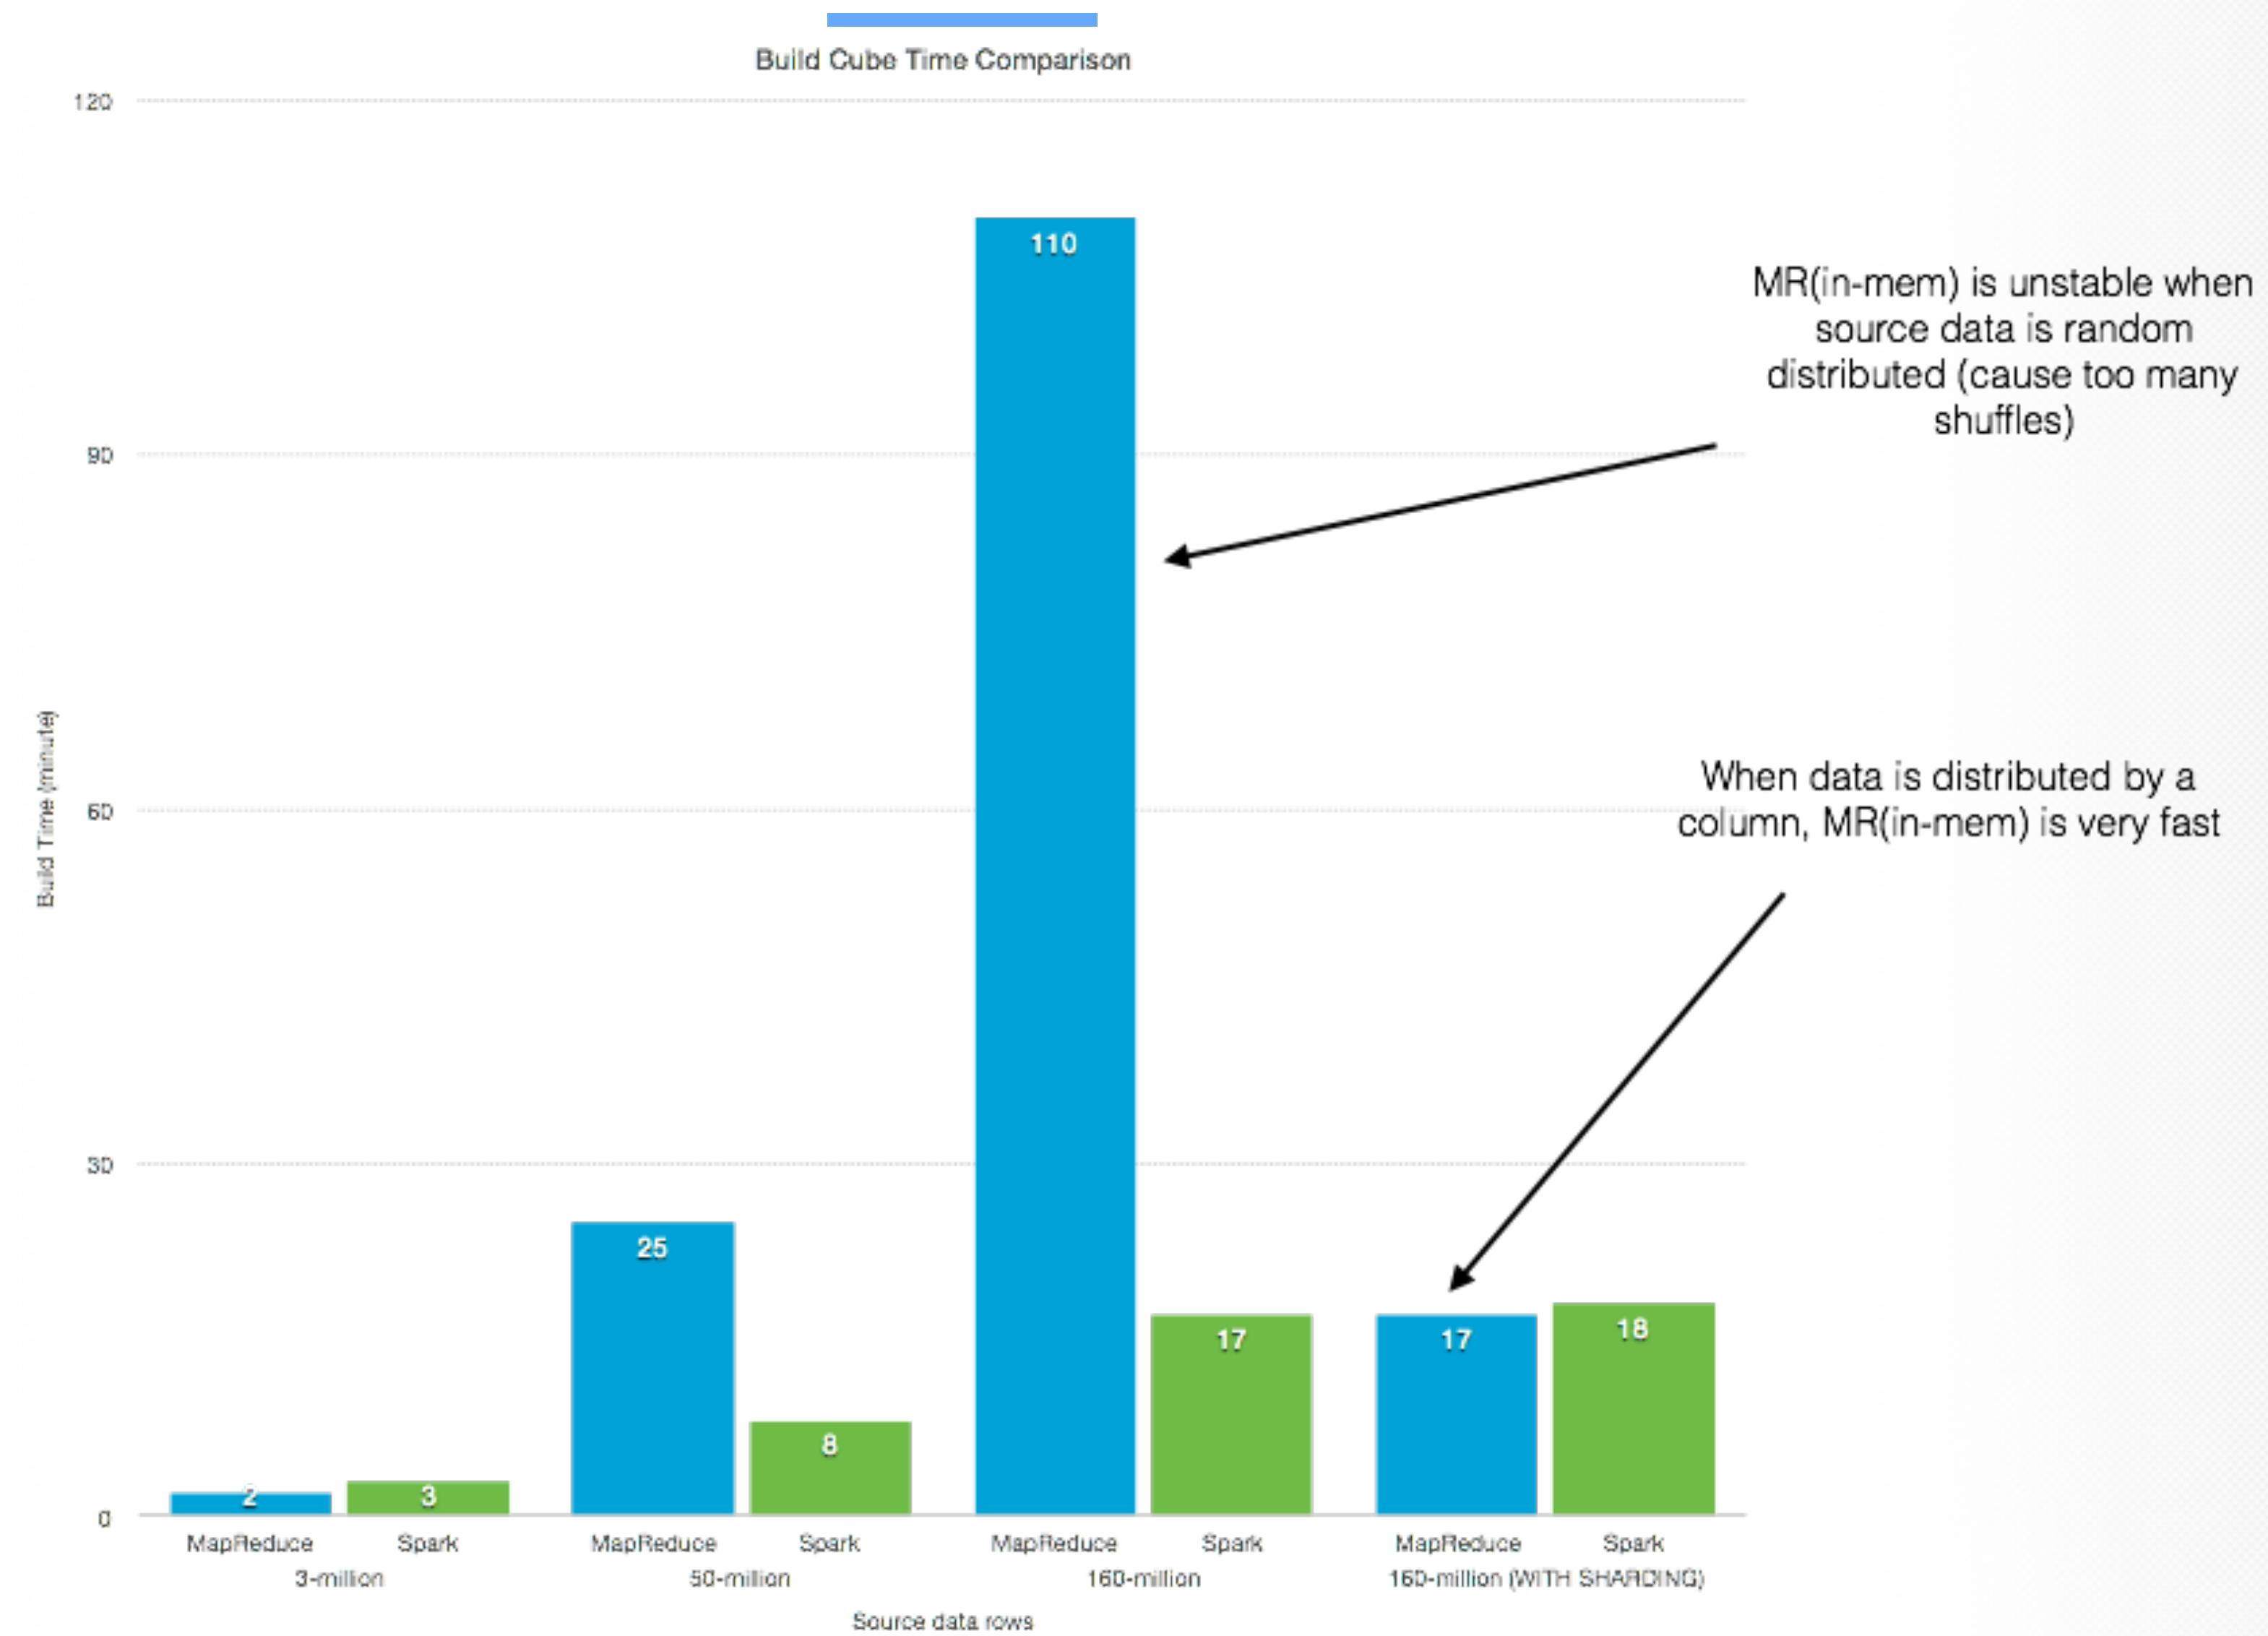

- Environment
 - 4 nodes Hadoop cluster; each node has 28 GB RAM and 12 cores
 - YARN has 48GB RAM and 30 cores in total
 - CDH 5.8, Apache Kylin 2.0 beta
- Spark
 - Spark 1.6.3 on YARN
 - 6 executors, each has 4 cores, 4GB +1GB (overhead) memory
- Test Data
 - Airline data, total 160 million rows
 - Cube: 10 dimensions, 5 measures (SUM)
- Test Scenarios
 - Build the cube at different source data scale: 3 million, 50 million and 160 million source rows
 - Compare the build time with MapReduce (both by layer and in-mem) and Spark. No compression
 - The time only cover the building cube step, not including preparations and subsequent steps

Spark Cubing vs. MR Layered Cubing

70% to 130% improvement on Spark

Spark Cubing vs. MR In-mem Cubing

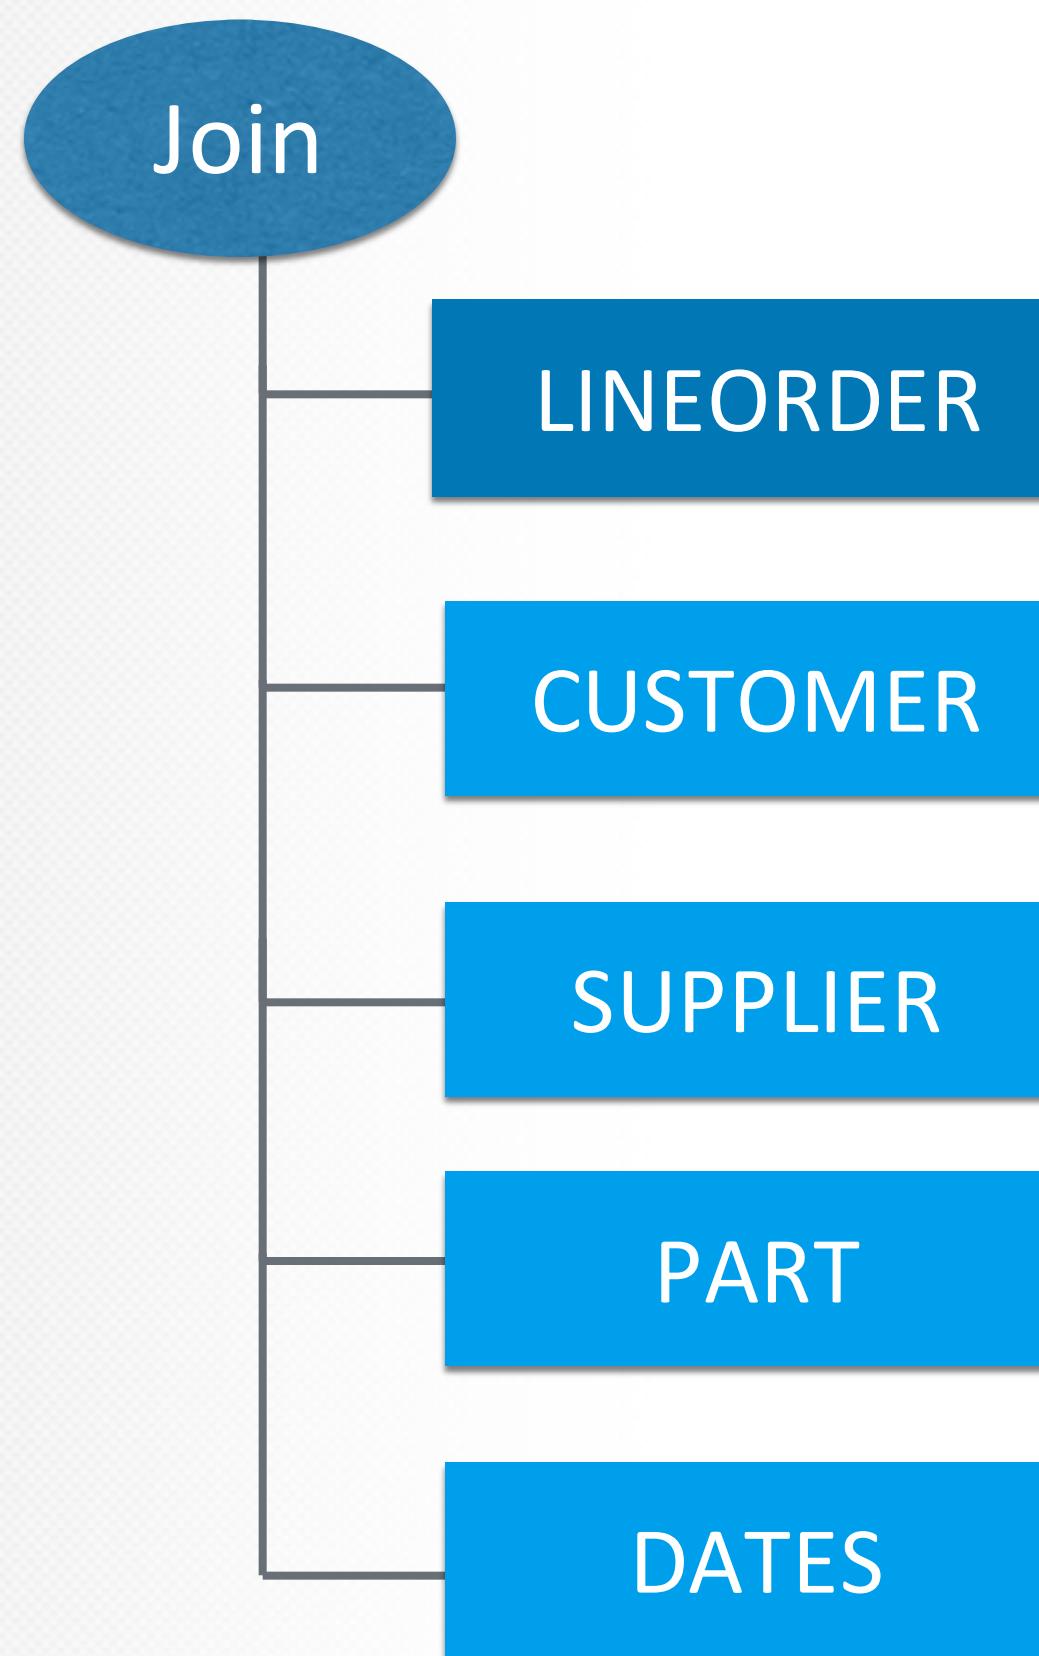

结论

- Layered cubing algorithm is stable on both MR and Spark
- Compared with MR layered Cubing, 70% to 130% performance improvement is observed on Spark Cubing
- When source data is sharded, Spark still keeps close performance with MR in-mem cubing
- There's still room for improvement

雪花模型的支持

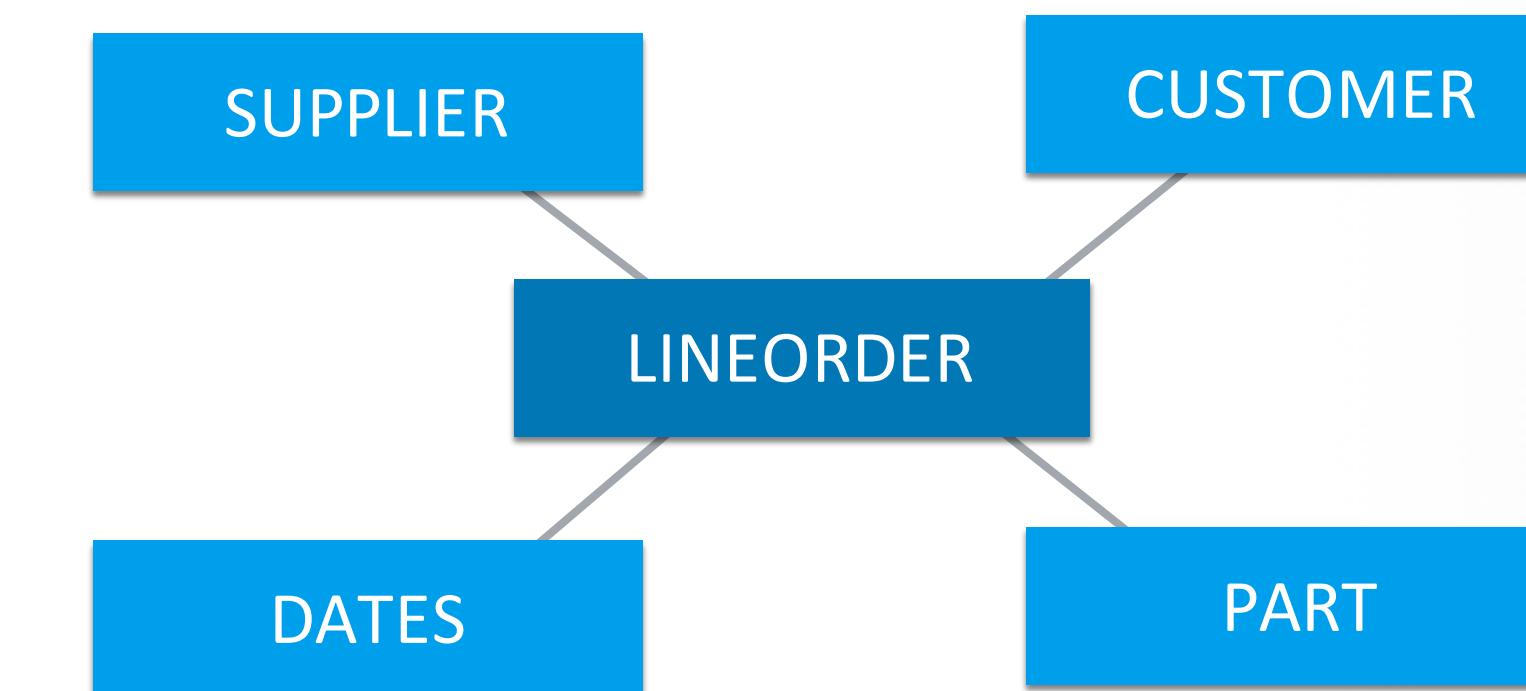

运行TPC-H benchmark

Kylin 1.0 Star Schema Limitation

Pre-calculate the join of 1 level of lookups

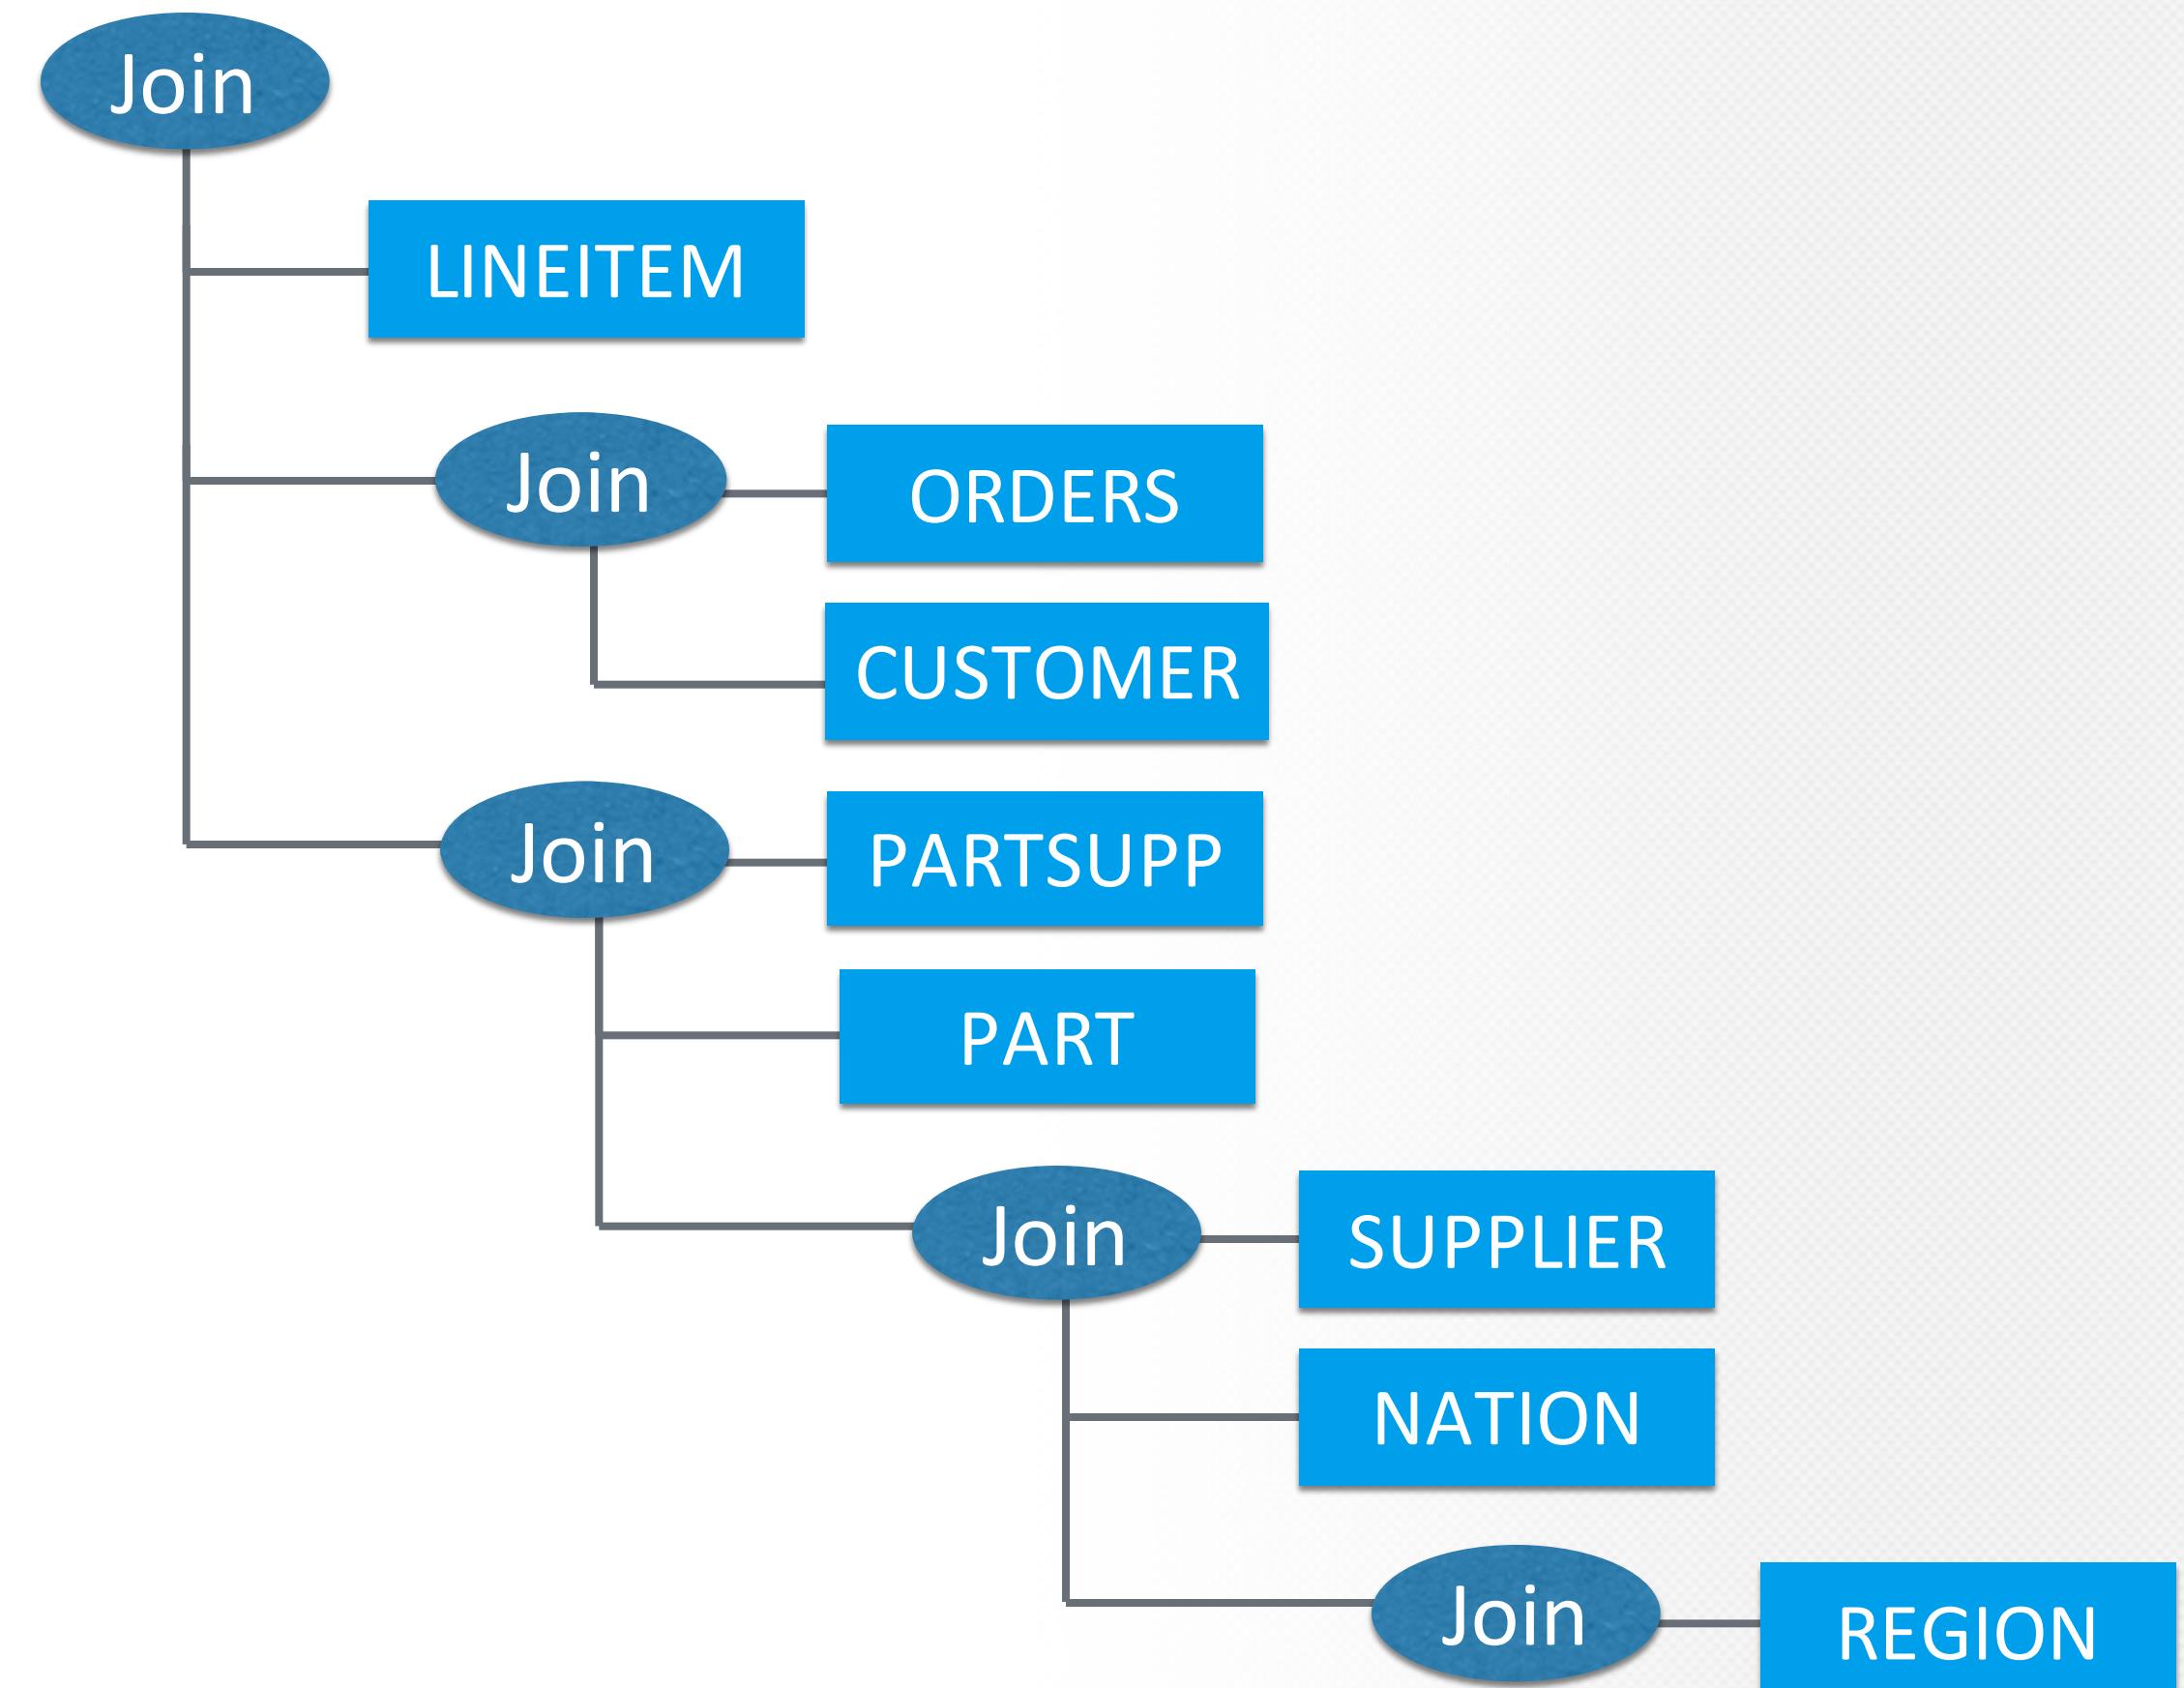

- Support star schema only
- Not allow same name columns from different tables
- Not allow table joining itself
- Difficult to support real world business cases

Kylin 2.0 Snowflake Schema

Pre-calculate unlimited levels of lookups

- Snowflake schema support ([KYLIN-1875](#))
- Allow table be joined multiple times
- Big metadata change at Model level
- Many bug fixes regarding joins and sub-queries
- Support complex models of any kind, support flexible queries on the models

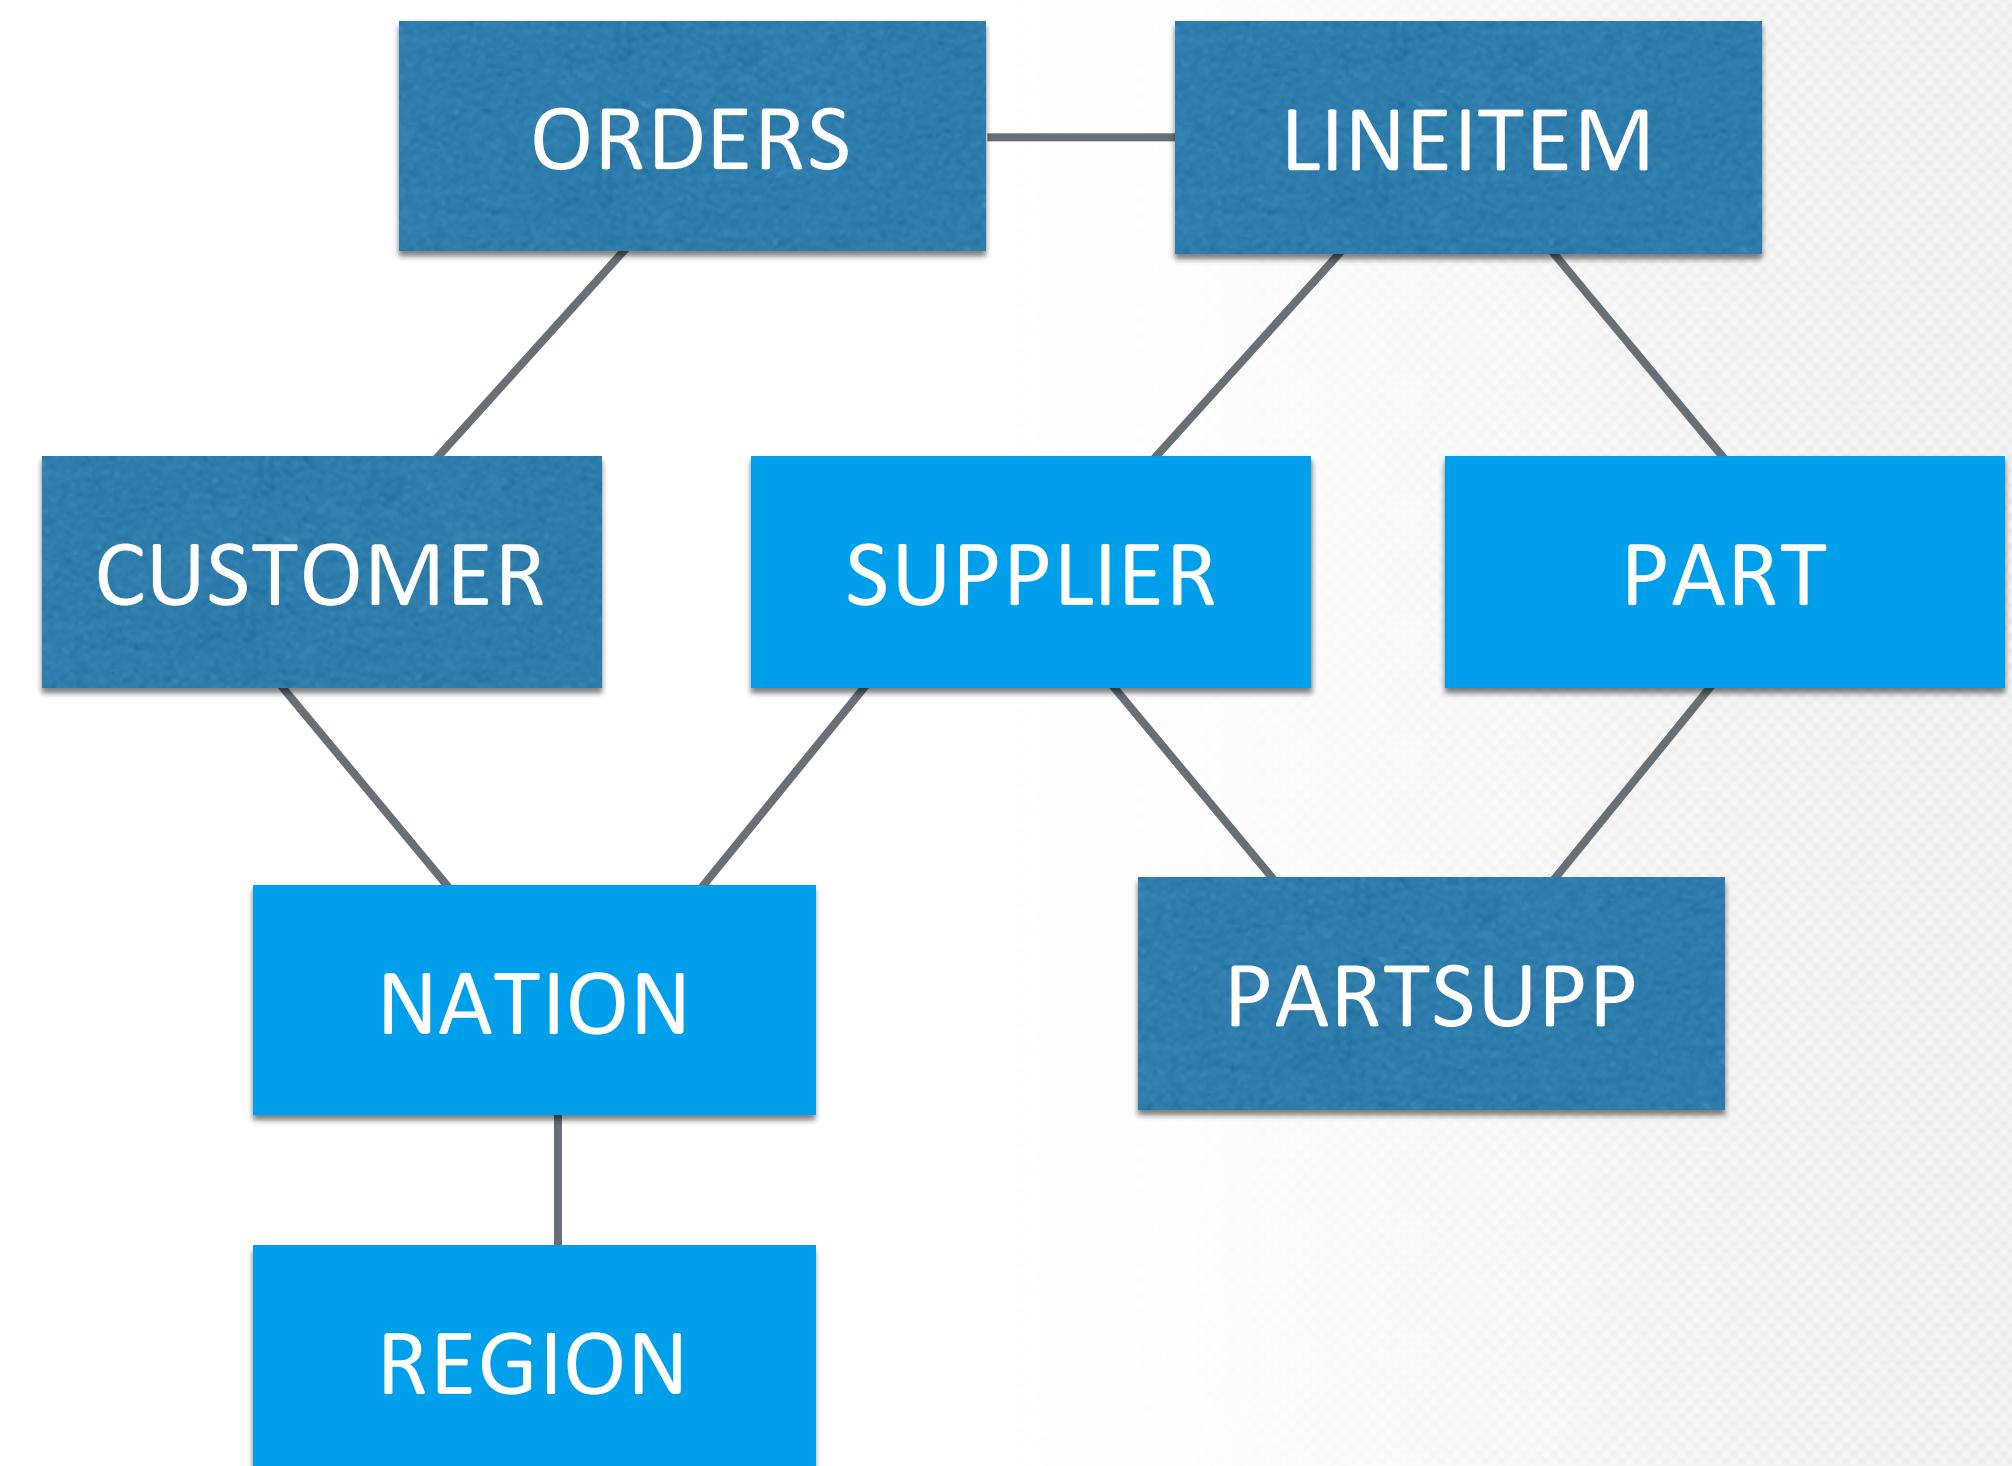

TPC-H on Kylin 2.0

TPC-H is a benchmark for decision support system.

- Popular among commercial RDBMS & DW solutions
- Queries and data have broad industry-wide relevance
- Examine large volumes of data
- Execute queries with a high degree of complexity
- Give answers to critical business questions

Kylin 2.0 runs all the 22 TPC-H queries. (KYLIN-2467)

- Pre-calculation can answer very complex queries
- Goal is functionality at this stage
- Try it: <https://github.com/Kyligence/kylin-tpch>

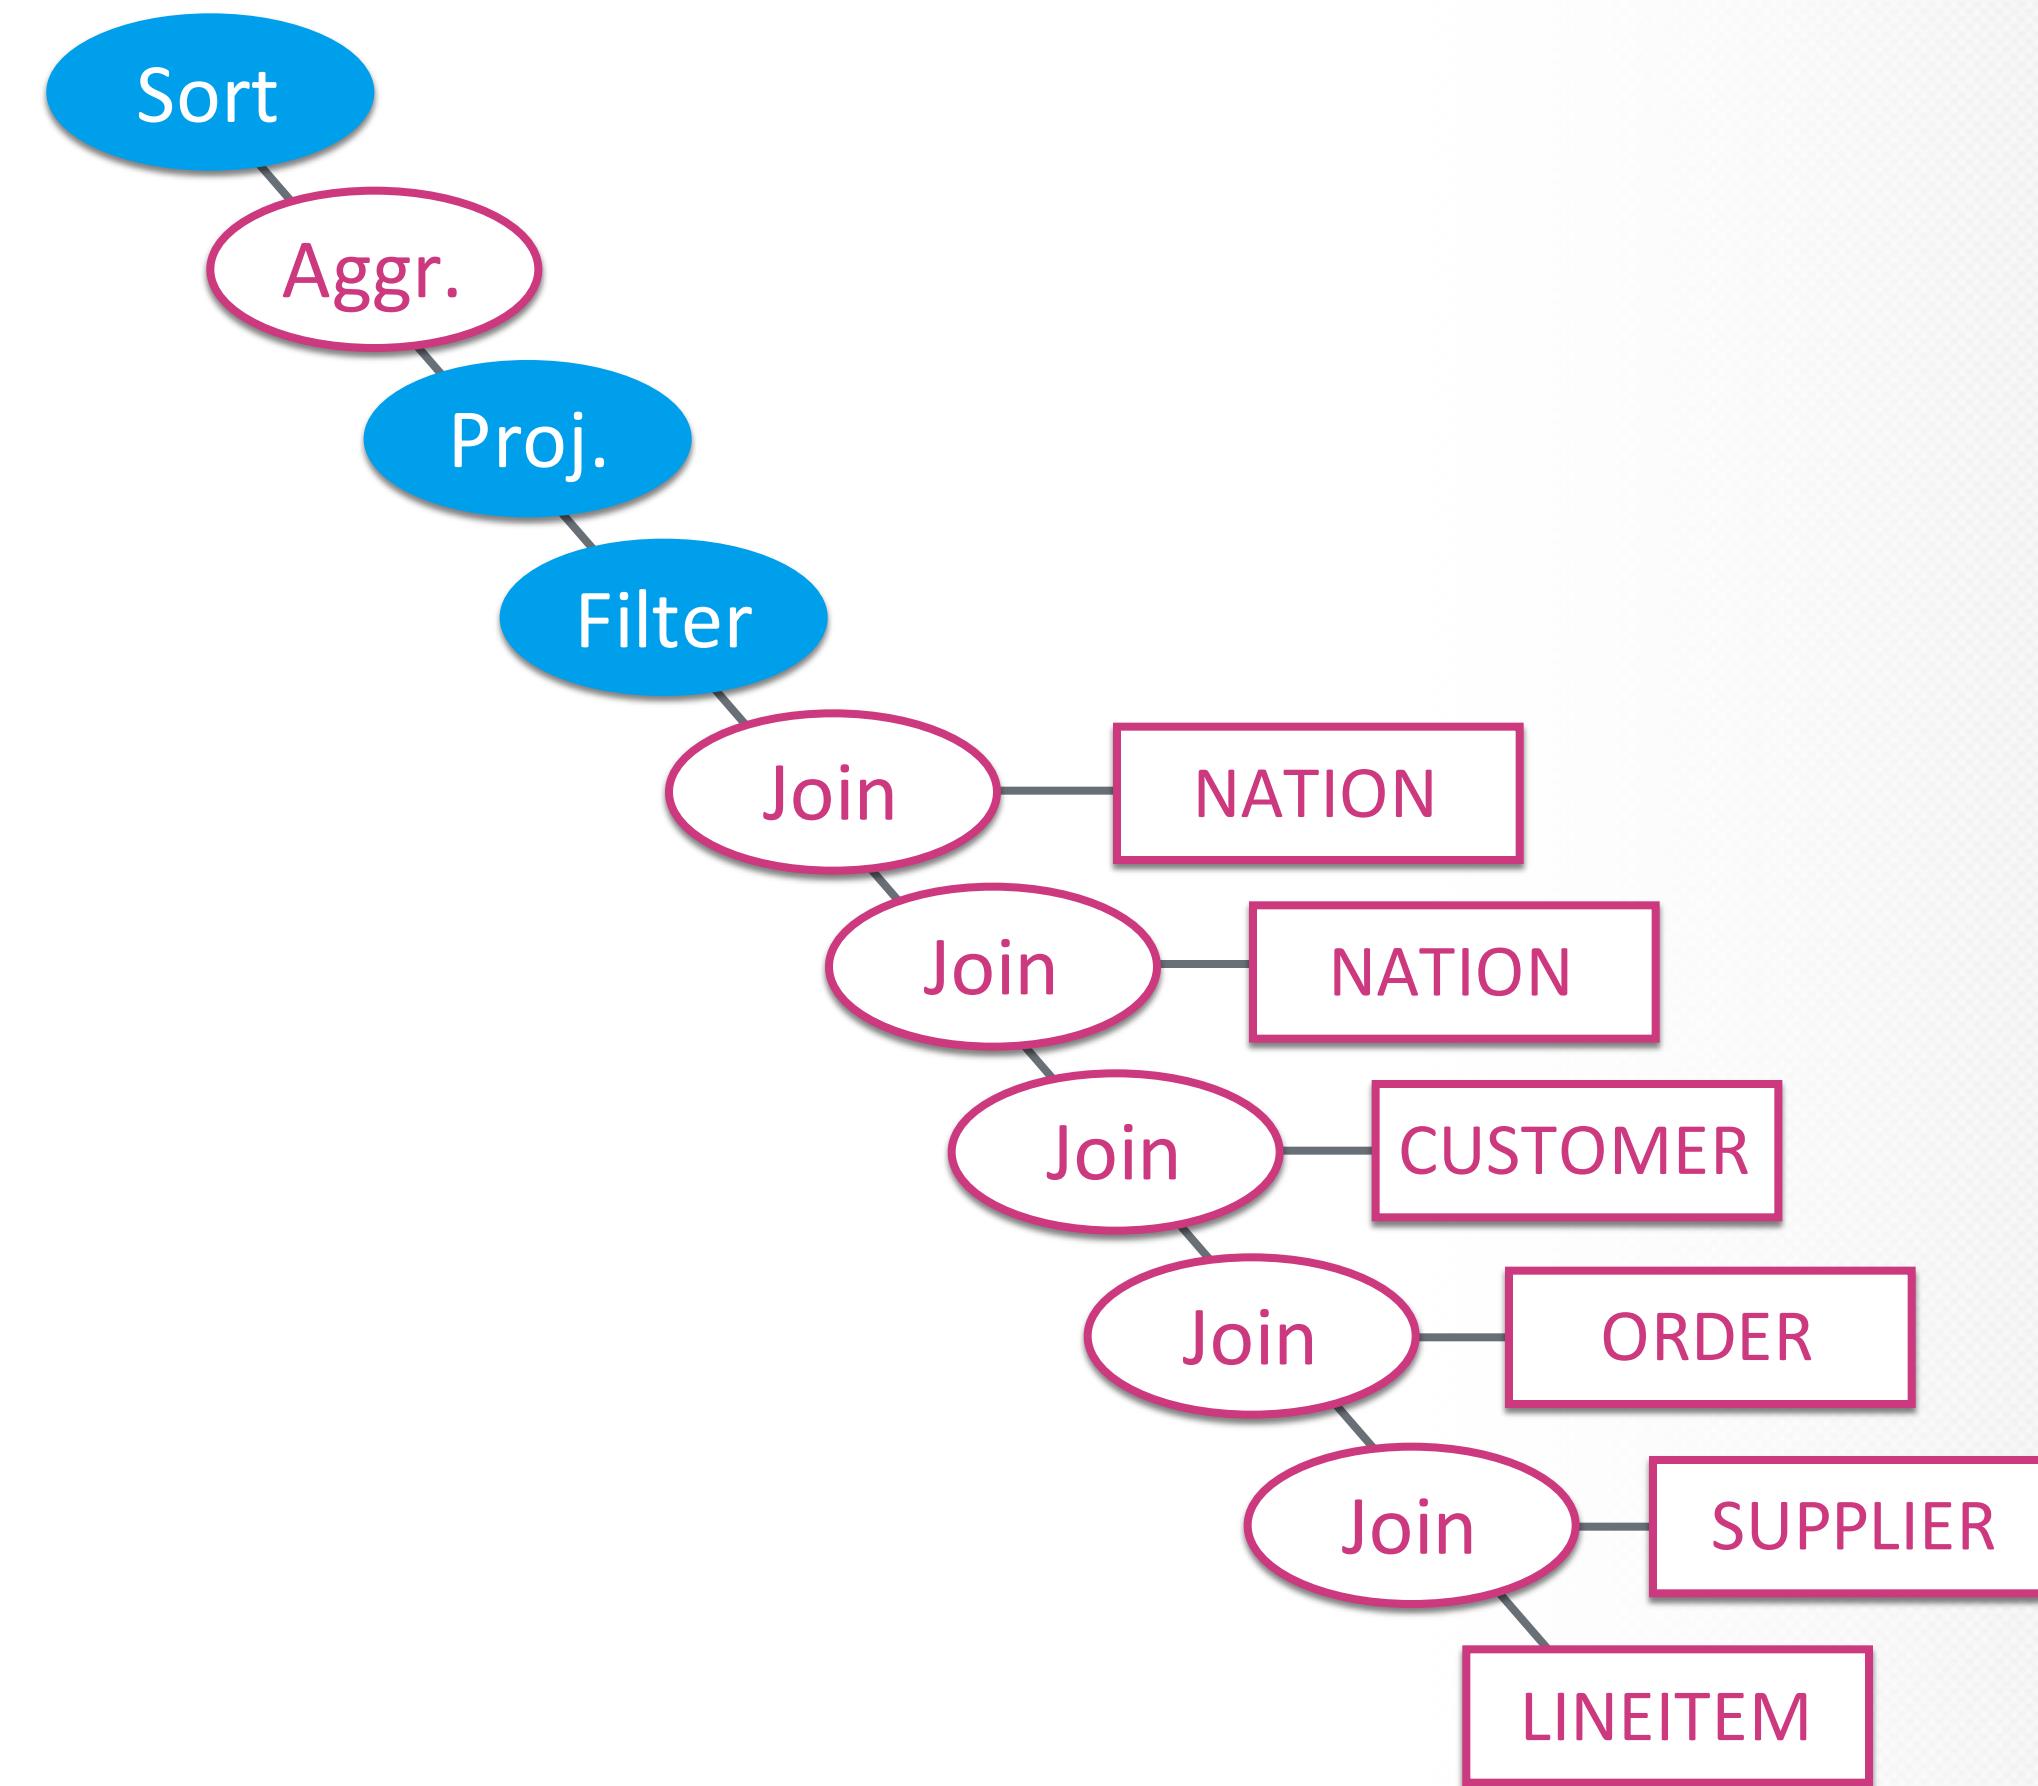

Complex Query 1

TPC-H query 07

- 0.17 sec (Hive+Tez 35.23 sec)
- 2 sub-queries

```

select
    supp_nation,
    cust_nation,
    l_year,
    sum(volume) as revenue
from
(
    select
        n1.n_name as supp_nation,
        n2.n_name as cust_nation,
        l_shipyear as l_year,
        l_saleprice as volume
    from
        v_lineitem
        inner join supplier on s_suppkey = l_suppkey
        inner join v_orders on l_orderkey = o_orderkey
        inner join customer on o_custkey = c_custkey
        inner join nation n1 on s_nationkey = n1.n_nationkey
        inner join nation n2 on c_nationkey = n2.n_nationkey
    where
        (
            (n1.n_name = 'KENYA' and n2.n_name = 'PERU')
            or (n1.n_name = 'PERU' and n2.n_name = 'KENYA')
        )
        and l_shipdate between '1995-01-01' and '1996-12-31'
) as shipping
group by
    supp_nation,
    cust_nation,
    l_year
order by
    supp_nation,
    cust_nation,
    l_year
  
```

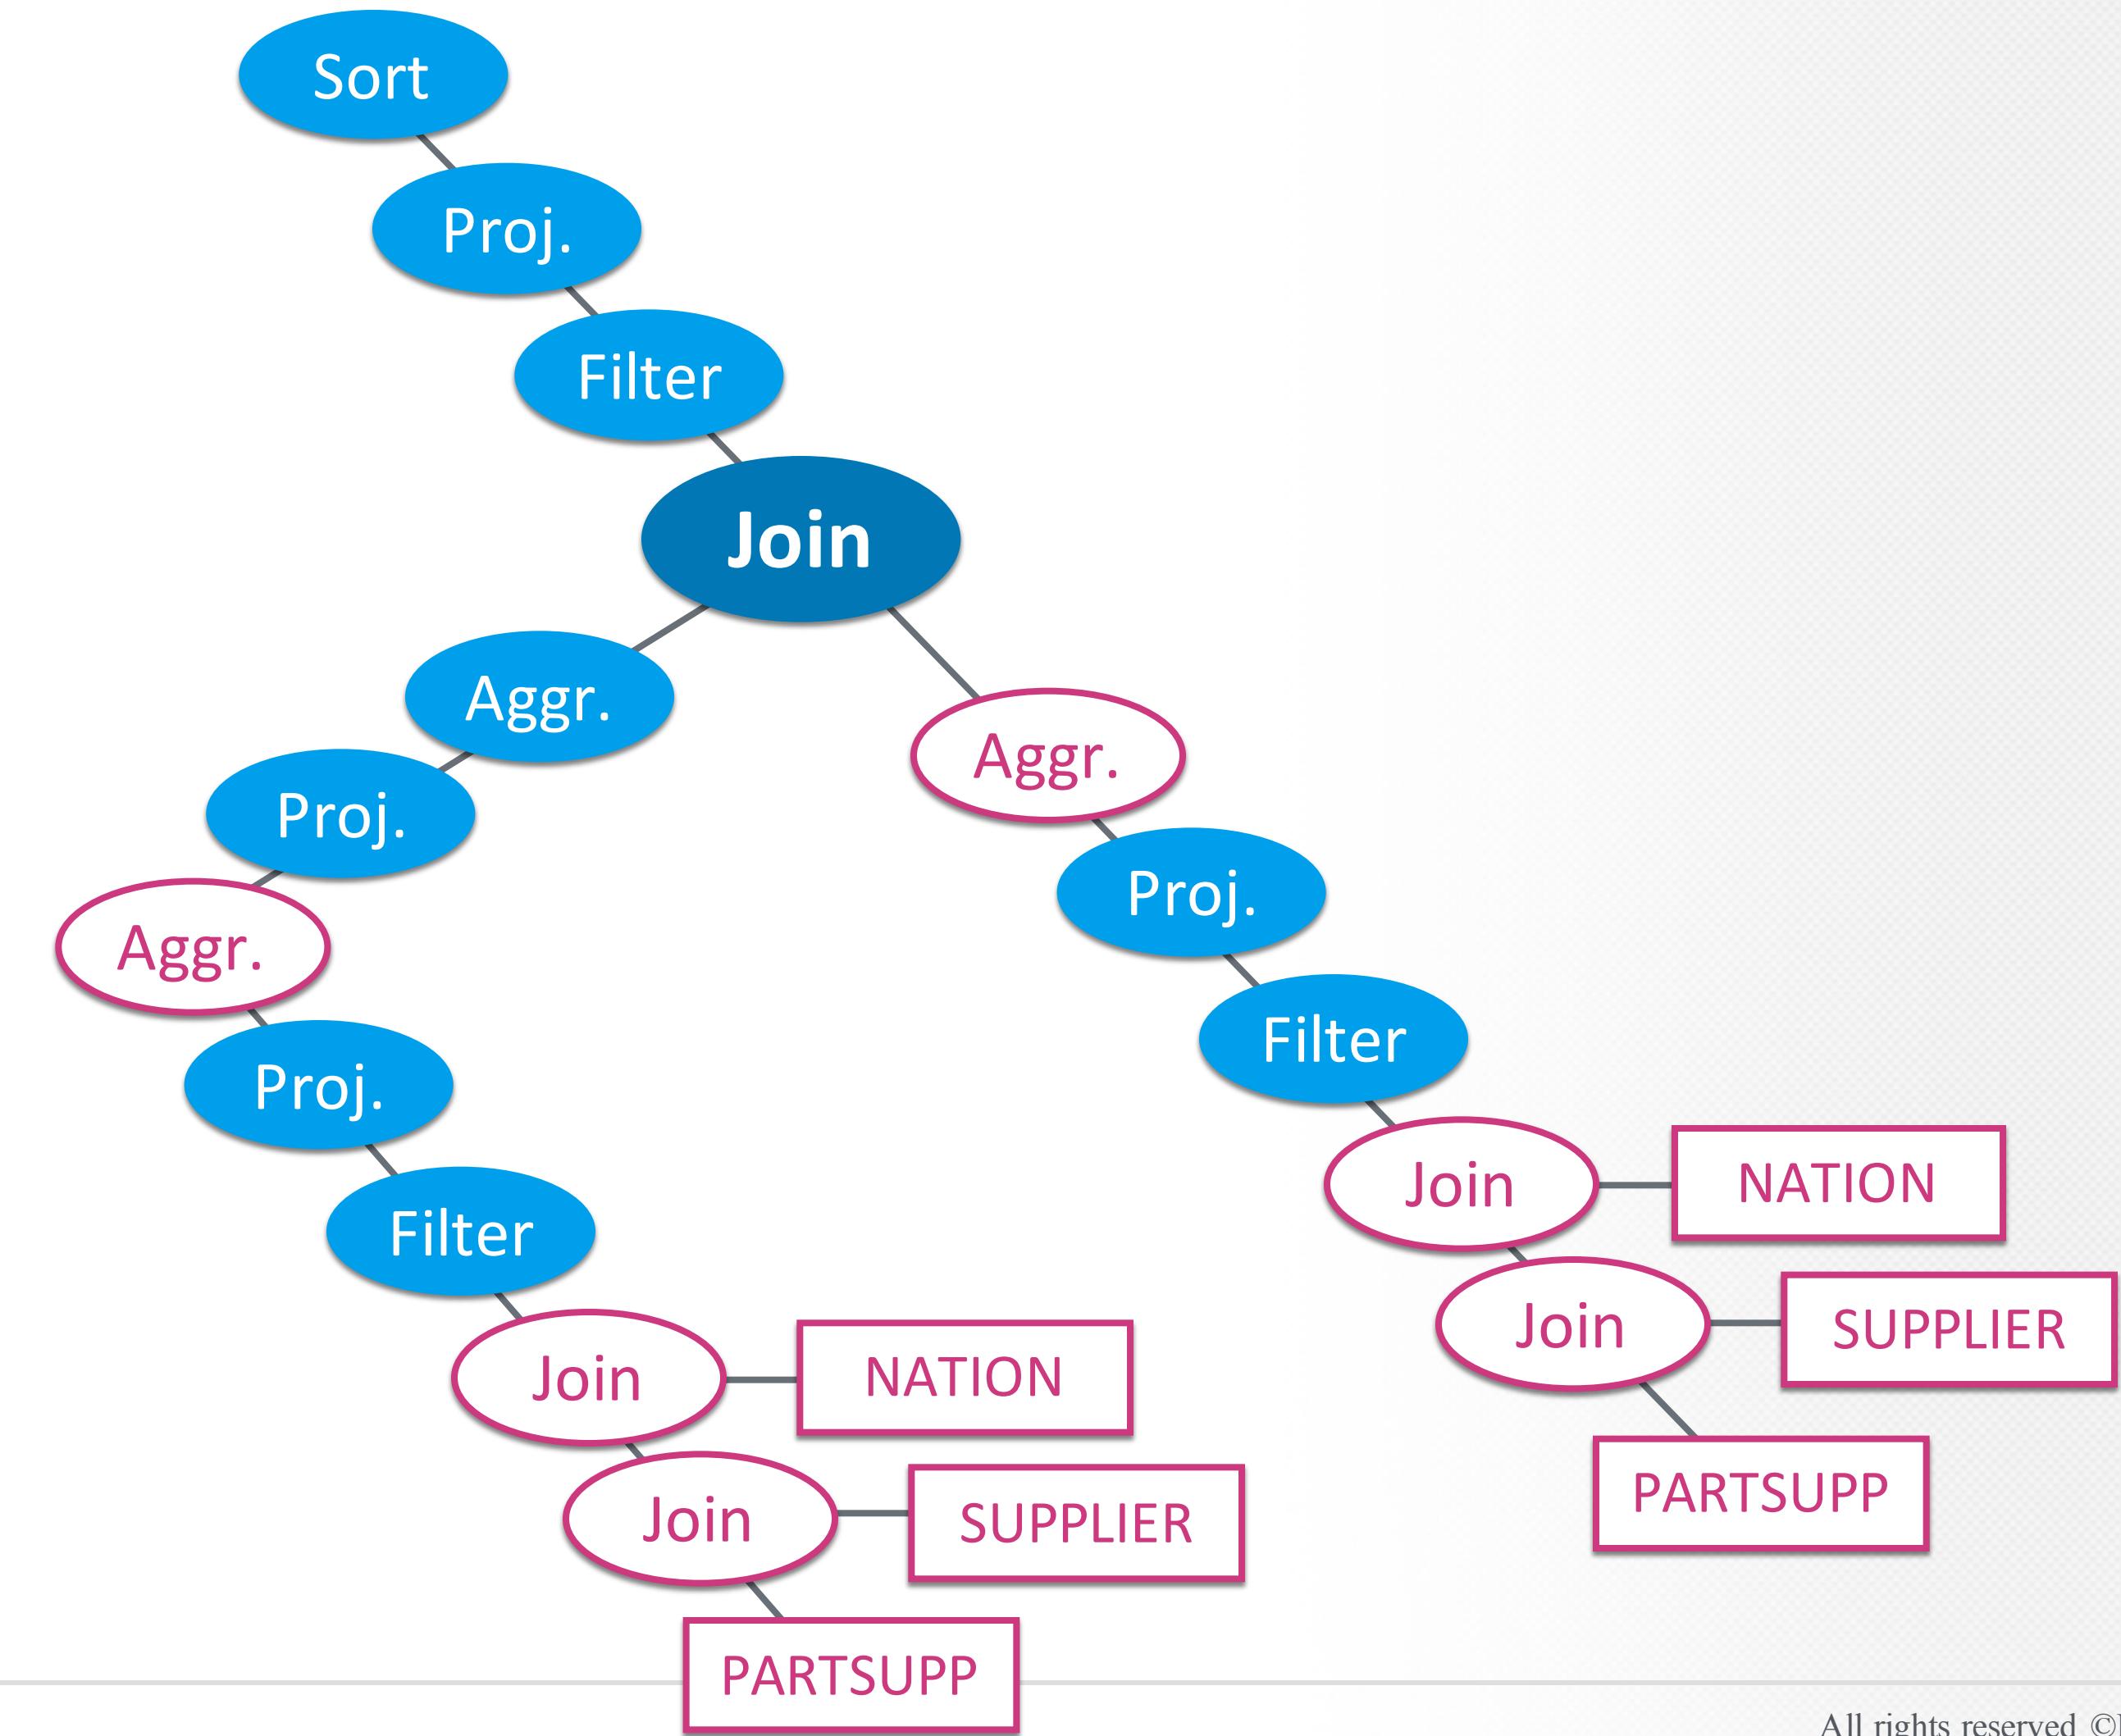

Complex Query 2

TPC-H query 11

- 3.42 sec (Hive+Tez 15.87 sec)
- 4 sub-queries, 1 online join

```
with q11_part_tmp_cached as (
  select
    ps_partkey,
    sum(ps_partvalue) as part_value
  from
    v_partsupp
    inner join supplier on ps_suppkey = s_suppkey
    inner join nation on s_nationkey = n_nationkey
  where
    n_name = 'GERMANY'
  group by ps_partkey
),
q11_sum_tmp_cached as (
  select
    sum(part_value) as total_value
  from
    q11_part_tmp_cached
)
select
  ps_partkey,
  part_value
from (
  select
    ps_partkey,
    part_value,
    total_value
  from
    q11_part_tmp_cached, q11_sum_tmp_cached
) a
where
  part_value > total_value * 0.0001
order by
  part_value desc;
```

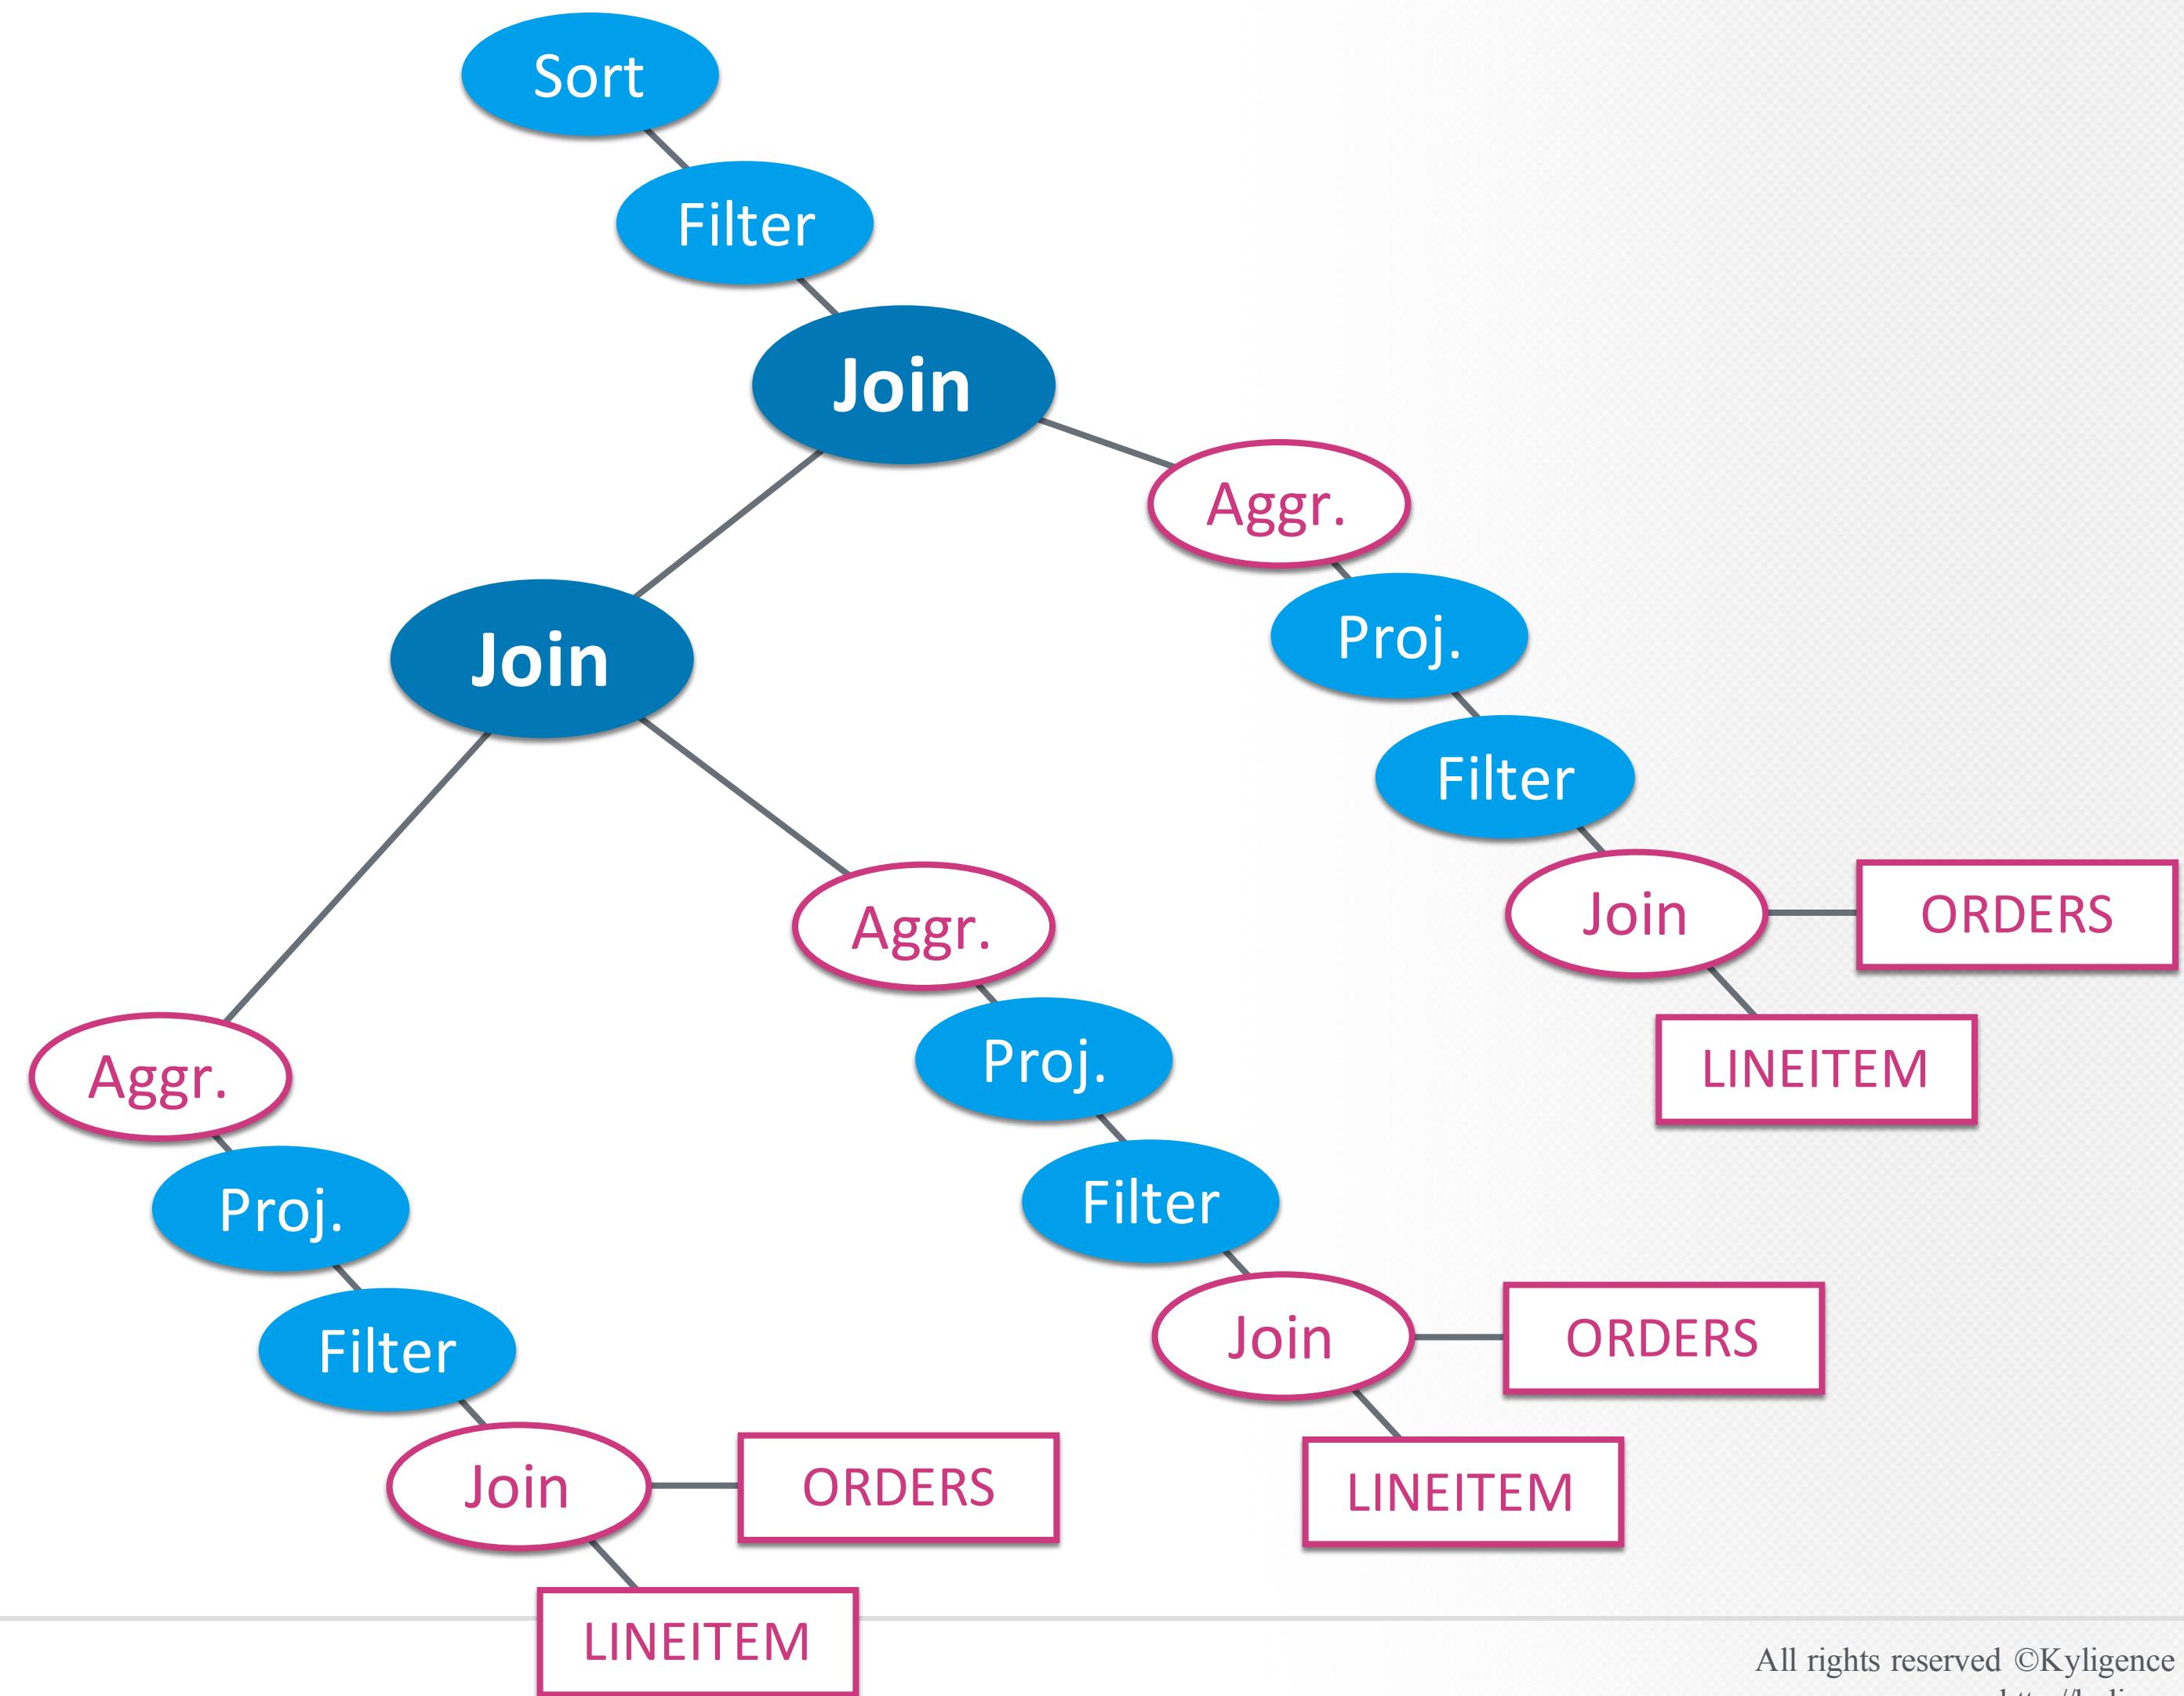

Complex Query 3

TPC-H query 12

- 7.66 sec (Hive+Tez 12.64 sec)
- 5 sub-queries, 2 online joins

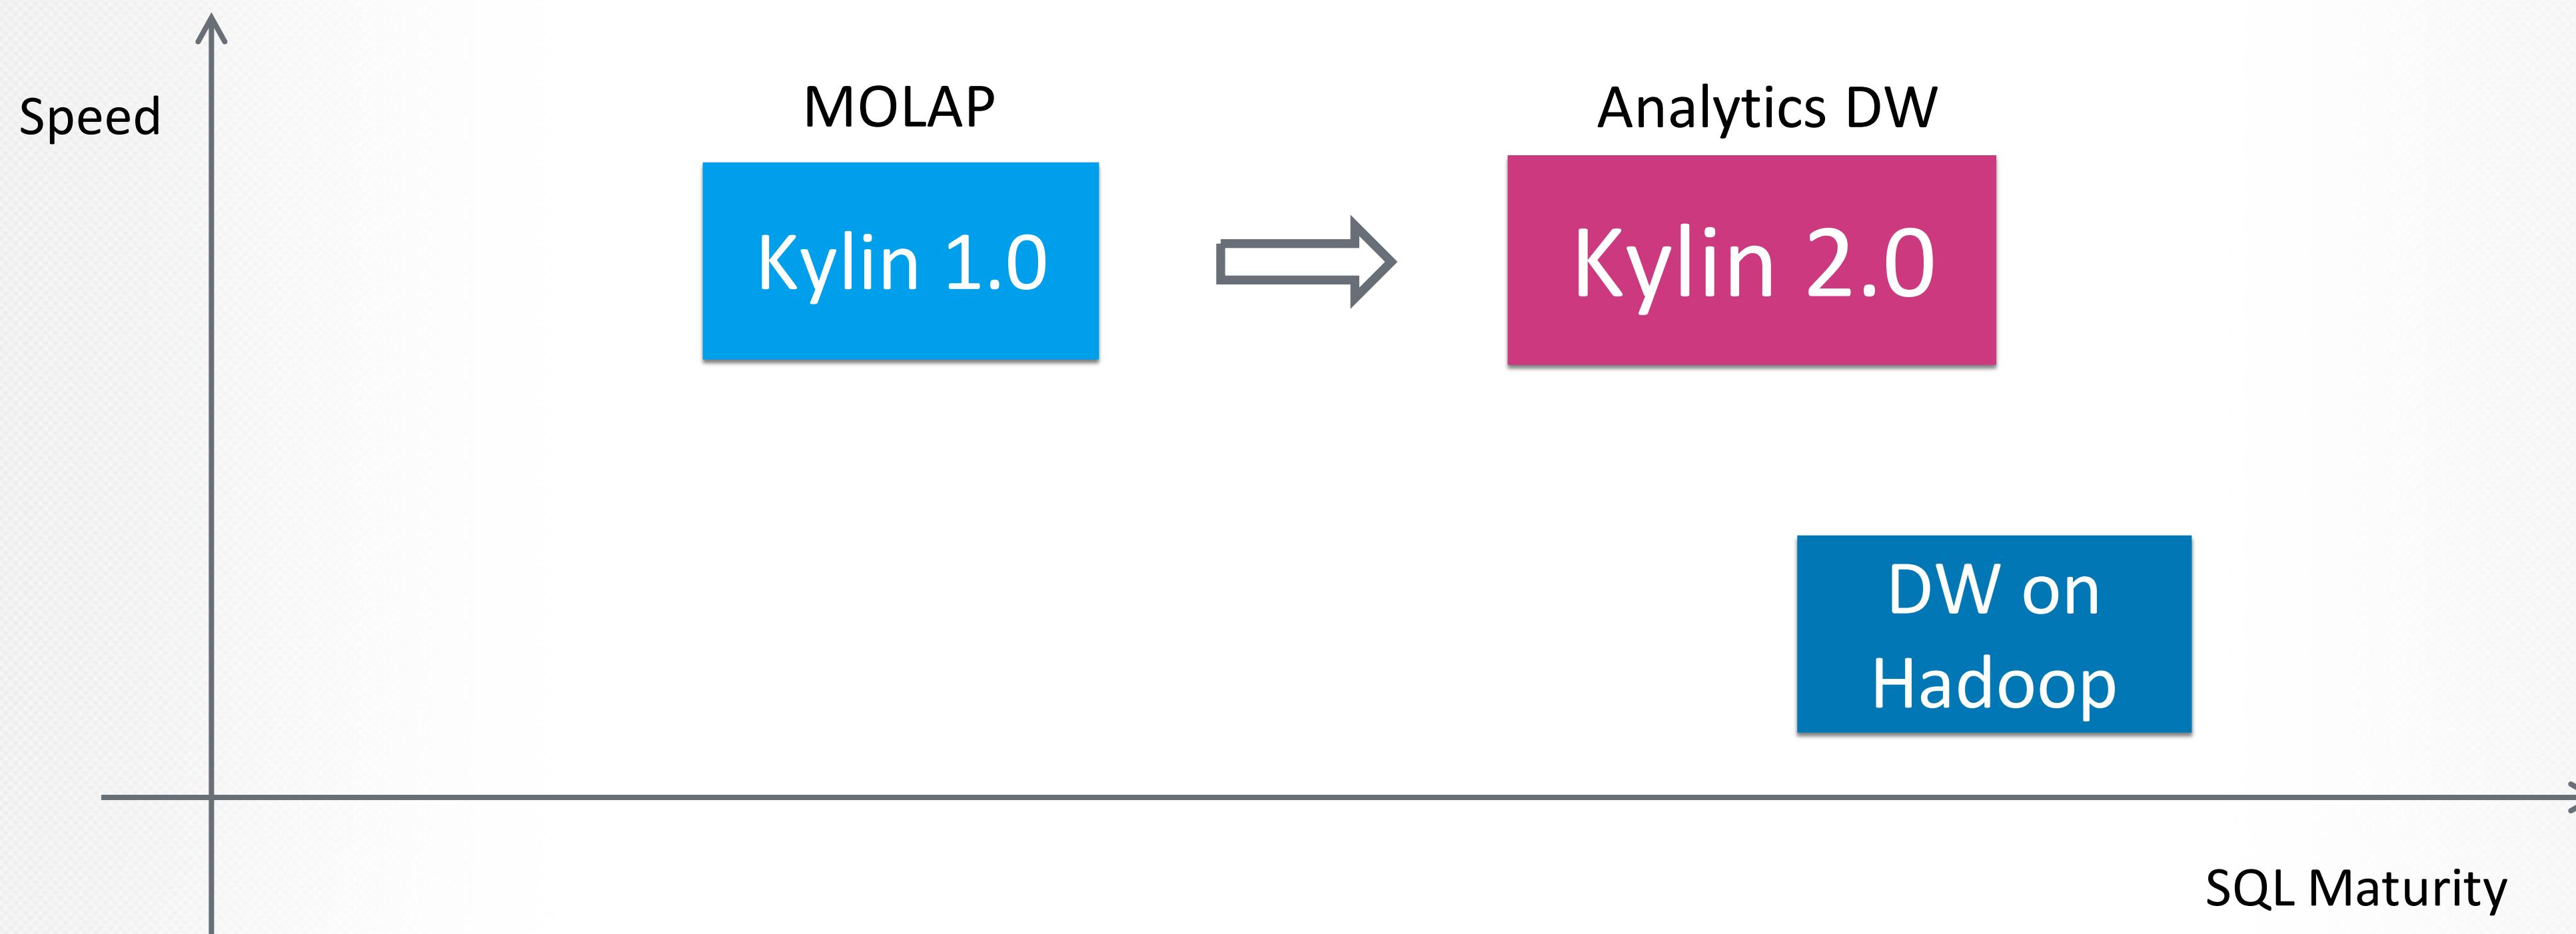

```

within_scope_data as(
  select
    l_shipmode,
    o_orderpriority
  from
    v_lineitem inner join v_orders on l_orderkey = o_orderkey
  where
    l_shipmode in ('REG AIR', 'MAIL')
    and l_receiptdelayed = 1
    and l_shipdelayed = 0
    and l_receiptdate >= '1995-01-01'
    and l_receiptdate < '1996-01-01'
), all_l_shipmode as(
  select
    distinct l_shipmode
  from
    in_scope_data
), high_line as(
  select
    l_shipmode,
    count(*) as high_line_count
  from
    in_scope_data
  where
    o_orderpriority = '1-URGENT' or o_orderpriority = '2-HIGH'
  group by l_shipmode
), low_line as(
  select
    l_shipmode,
    count(*) as low_line_count
  from
    in_scope_data
  where
    o_orderpriority <> '1-URGENT' and o_orderpriority <> '2-HIGH'
  group by l_shipmode
)
select
  al.l_shipmode, hl.high_line_count, ll.low_line_count
from
  all_l_shipmode al
  left join high_line hl on al.l_shipmode = hl.l_shipmode
  left join low_line ll on al.l_shipmode = ll.l_shipmode
order by
  al.l_shipmode
  
```

More than MOLAP

- Supports complex data models and sub-queries; Runs TPC-H
- Percentile / Window / Time functions

总结

Apache Kylin 2.0

- Kylin 2.0 Beta 可供下载.
- Spark cubing
- 雪花模型的支持
- 可尝试的TPC-H benchmark
- 时间函数/窗口函数/百分比函数
- 近实时流式处理

What is next

- Hadoop 3.0 支持(Erasure Coding)
- 完善Spark Cubing
- 连接更多数据源(JDBC, SparkSQL)
- 替换存储层(Kudu?)
- 支持真正实时 lambda architecture
